EN Important Safety Instructions

Terminals marked with this symbol carry electrical current of sufficient magnitude to constitute risk of electric shock.

Use only high-quality professional speaker cables with ¼" TS or twist-locking plugs pre-installed. All other installation or modification should be performed only by qualified personnel.

This symbol, wherever it appears, alerts you to the presence of uninsulated dangerous voltage inside the enclosure - voltage that may be sufficient to constitute a risk of shock.

This symbol, wherever it appears, alerts you to important operating and maintenance instructions in the accompanying literature. Please read the manual.

Caution

To reduce the risk of electric shock, do not remove the top cover (or the rear section). No user serviceable parts inside. Refer servicing to qualified personnel.

Caution

To reduce the risk of fire or electric shock, do not expose this appliance to rain and moisture. The apparatus shall not be exposed to dripping or splashing liquids and no objects filled with liquids, such as vases, shall be placed on the apparatus.

Caution

These service instructions are for use by qualified service personnel only. To reduce the risk of electric shock do not perform any servicing other than that contained in the operation instructions. Repairs have to be performed by qualified service personnel.

1. Read these instructions.
2. Keep these instructions.
3. Heed all warnings.
4. Follow all instructions.
5. Do not use this apparatus near water.
6. Clean only with dry cloth.
7. Do not block any ventilation openings. Install in accordance with the manufacturer's instructions.
8. Do not install near any heat sources such as radiators, heat registers, stoves, or other apparatus (including amplifiers) that produce heat.

9. Do not defeat the safety purpose of the polarized or grounding-type plug. A polarized plug has two blades with one wider than the other. A grounding-type plug has two blades and a third grounding prong. The wide blade or the third prong are provided for your safety. If the provided plug does not fit into your outlet, consult an electrician for replacement of the obsolete outlet.

10. Protect the power cord from being walked on or pinched particularly at plugs, convenience receptacles, and the point where they exit from the apparatus.

11. Use only attachments/accessories specified by the manufacturer.

12. Use only with the cart, stand, tripod, bracket, or table specified by the manufacturer, or sold with the apparatus. When a cart is used, use caution when moving the cart/apparatus combination to avoid

injury from tip-over.

13. Unplug this apparatus during lightning storms or when unused for long periods of time.

14. Refer all servicing to qualified service personnel. Servicing is required when the apparatus has been damaged in any way, such as power supply cord or plug is damaged, liquid has been spilled or objects have fallen into the apparatus, the apparatus has been exposed to rain or moisture, does not operate normally, or has been dropped.

15. The apparatus shall be connected to a MAINS socket outlet with a protective earthing connection.

16. Where the MAINS plug or an appliance coupler is used as the disconnect device, the disconnect device shall remain readily operable.

17. Correct disposal of this product: This symbol indicates that this product must not be disposed of with household waste, according to the WEEE Directive (2012/19/EU) and your national law. This product should be taken to a collection center licensed for the recycling of waste electrical and electronic equipment (EEE). The mishandling of this type of waste could have a possible negative impact on the environment and human health due to potentially hazardous substances that are generally associated with EEE. At the same time, your cooperation in the correct disposal of this product will contribute to the efficient use of natural resources. For more information about where you can take your waste equipment for recycling, please contact your local city office, or your household waste collection service.

18. Do not install in a confined space, such as a book case or similar unit.

19. Do not place naked flame sources, such as lighted candles, on the apparatus.

20. Please keep the environmental aspects of battery disposal in mind. Batteries must be disposed-of at a battery collection point.

21. Use this apparatus in tropical and/or moderate climates.

For the applicable warranty terms and conditions and additional information regarding MUSIC Group's Limited Warranty, please see complete details online at music-group.com/warranty.

1. Introduction

Congratulations on your purchase of the new MIDAS M AIR series digital mixer. These mixers offer plenty of analog I/O for most performances in a very compact form factor that is easy to transport, but doesn't sacrifice any mixing power. With high-end features taken from the M32 mixer, such as MIDAS PRO preamps, high-quality effects, P-16 monitoring on the MR18, and USB recording capability, these consoles far outperform their size.

Mixing live shows can now be done from anywhere in the venue thanks to the wireless control options that allow all software functions to be controlled from an iPad*, Android* tablet or PC. While a dedicated external router can be used, it is not necessary thanks to the integrated Wifi module. This allows monitors to be adjusted while standing on stage, and the main mix to be perfected from anywhere in the crowd.

In addition to dedicated aux buses for monitoring, the M AIR has 4 studio-quality stereo effects processors. In fact, these are the same great effects found in the acclaimed M32 mixer, including legendary reverb, echo and chorus algorithms.

Not just a live sound tool, the MR18 features an 18x18 USB audio/MIDI interface, and the MR12 allows 2-track stereo recording. This makes for a great mobile recording device, home studio interface, and enables live performances to be multitracked for later mixing.

Continue through this manual to learn all about the functionality of your mixer, as well as the M AIR software.

2. Callouts

2.1 MR18 Callouts

- 1 **INPUTS** accept balanced and unbalanced XLR and 1/4" plugs.
- 2 **MAIN L & R** jacks send the main mix signal to PA or monitor speakers via XLR cables.
- 3 **HEADPHONE** jack accepts a 1/4" TRS plug for connecting a pair of headphones.
- 4 **PHONES LEVEL** knob determines the output of the headphones jack.
- 5 **POWER** switch turns the power on and off. The LED on the main input panel will light when the unit is powered on.
- 6 **USB** port (type B) accepts a USB cable for connection to a computer for multi-channel audio and MIDI recording. Up to 18 audio channels can be simultaneously recorded, and 18 channels are available for playback. The mixer application allows assignment of channels for recording and playback. 16 channels of MIDI I/O can also be transmitted on the same USB connection. Check the product page on midasconsoles.com to download the required (Windows*) driver and the full manual for a comprehensive explanation of the interface.
- 7 **ETHERNET** port allows the mixer to be controlled via LAN or connected Wifi router.
- 8 **RESET** button resets the console to default network parameters when held for 2 seconds. When held for 10 seconds, all console functions are reset to factory default status.
- 9 **REMOTE** switch selects between Ethernet, Wifi client, or Access Point. See the Network Connection chapter for details.
- 10 **MIDI IN/OUT** jacks send and receive MIDI signals to and from external equipment. See the MIDI Implementation chart for details.
- 11 **ULTRANET** port allows connection of BEHRINGER P16-M personal monitoring mixers or P16-D distribution hubs.
- 12 **AUX SEND** jacks send your monitor mixes to active stage monitors or headphone mixers via XLR connectors.
- 13 **Inputs 17 and 18** accept balanced 1/4" cables for connecting line-level sources. These inputs have limited processing compared to the other input channels.

*Windows is either a registered trademark or trademark of Microsoft Corporation in the United States and/or other countries.

2.2 MR12 Callouts

- 1 **ETHERNET** port allows the mixer to be controlled via LAN or connected Wifi router.
- 2 **REMOTE** switch selects between Ethernet, Wifi client, or Access Point. See the Network Connection chapter for details.
- 3 **RESET** button resets the console to default network parameters when held for 2 seconds. When held for 10 seconds, all console functions are reset to factory default status.
- 4 **MIDI IN/OUT** jacks send and receive MIDI signals to and from external equipment. See the MIDI Implementation chart for details.
- 5 **USB** port (type A) accepts a flash drive for stereo recordings and playback. The red LED next to it indicates file access. Do not remove the USB flash drive while it is lit!
- 6 **XLR COMBO** jacks accept balanced and unbalanced XLR and 1/4" plugs.
- 7 1/4" inputs accept balanced or unbalanced 1/4" plugs. Channel 11 and 12 accept high impedance sources for direct connection of guitars and basses.
- 8 **AUX SEND** jacks send your monitor mixes to stage monitors or headphone mixers.
- 9 **MAIN L/R** jacks send the main mix signal to PA or monitor speakers via XLR cables.
- 10 **HEADPHONE** jack accepts a 1/4" TRS plug for connecting a pair of headphones.
- 11 **PHONES LEVEL** knob determines the output of the headphones jack.
- 12 **POWER** switch turns the mixer on and off. The front panel LED will light when the unit is powered on.

WiFi CLIENT mode (Mobile Devices with Wifi)

ACCESS POINT mode (Mobile Devices with Wifi)

ETHERNET mode

X-TOUCH

or any other MIDI / Mackie Control compatible Controller

4. Network Connection

The M AIR mixers offer convenient digital control of the various mixing functions in three different ways - via Ethernet LAN, or wirelessly as a Wifi Client or as an Access Point. Selection is made with the REMOTE switch. You may view or change the network preferences for these on any of the M AIR remote control applications on the 'Setup/Network' page.

4.1 IP Address and DHCP

Depending on the connection scenario, the M AIR mixers offer up to 3 options for connecting a tablet or PC for software control – DHCP Client, DHCP Server, and fixed IP operation. Connection is achieved differently depending on which option you choose:

DHCP Client mode is available in Ethernet LAN or Wifi Client operation. The mixer will automatically request an IP lease from the DHCP server that owns the IP addresses in the network to which you are trying to connect.

DHCP Server (DHCPs) is optionally available for Ethernet LAN connections and is standard in Access Point operation. The mixer will own the IP addresses and provide IP leases to devices requesting access to that network. The mixer will always use IP address 192.168.1.1 and assign IP addresses 192.168.1.101 – 192.168.1.132 to its clients.

Static IP is available for Ethernet LAN and Wifi Client operation. The mixer will use the fixed (static) IP address, subnet mask and gateway that you specify for registering on the network. Make sure that the addresses you specify manually are not conflicting with any other addresses on the same network. We generally recommend using the DHCP mode, unless you have a very specific reason to set it up manually.

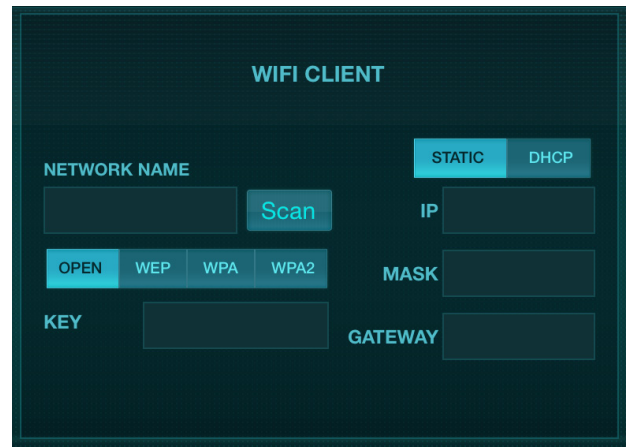

Note: Changing parameters of the currently selected connection mode will disconnect the software from the console. If the console is erroneously configured for a fixed IP address that is incompatible with the network it is connected to, the console will be inaccessible. In this case, one of the other two connection modes can be used to regain access and amend the settings. If that does not work, hold the Reset button for 2 seconds to return to default network settings.

Mixer name and Ethernet setup screen

4.2 Ethernet/LAN

This mode supports DHCP Client (default), DHCP Server, and fixed IP operation. Note that if the mixer is connected to a network where no DHCP server is present, the mixer will generate an automatic IP address (range 169.254.1.0 – 169.254.254.255). There are no security options for LAN connections, so any device in that network may take control of connected M AIR consoles. When connecting via LAN/Ethernet to a Wifi router, make sure the security settings of that router prevent unauthorized access.

Wifi Client setup screen

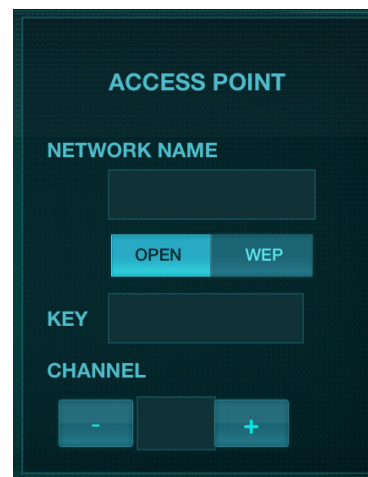

4.3 Wifi Client

This mode supports DHCP Client (default) and fixed IP operation. The M AIR mixers can support WEP, WPA and WPA2 security mechanisms in Wifi Client mode and works on Wifi channels 1-11.

Correct SSID (network name) and password need to be supplied to connect to an existing network. WEP passwords have to be either 5 characters or 13 characters long. If the supplied SSID and password are incorrect, the mixer cannot be accessed. In this case the networking parameters have to be reset and another connection mode has to be used to regain access.

The Ethernet connection mode may be used for configuration of the Wifi Client mode. While being connected in Ethernet mode, the M AIR mixer can scan the available wireless networks and display their SSID network names, field strength and security method. By selecting the preferred wireless network, this information can be copied to the applications' Wifi Client setup page automatically. You will then be prompted to fill in the security password of that network. After switching from Ethernet to Wifi Client mode, the mixer should connect to the selected wireless network automatically, and will be displayed by remote applications on any device connected to the same network.

Access Point setup screen

4.4 Access Point

This mode only supports DHCP Server operation with a maximum of 4 clients, working on Wifi channels 1-11. Security is supported via WEP 40-bit (5 ASCII characters) or WEP 104-bit (13 ASCII characters). By default, the mixer will use a network name consisting of the model name plus the last bits of the mixer's unique MAC address (e.g. MR18-17-BE-C0). The default IP address is 192.168.1.1 and no security is engaged.

The control software is available for Android and iPad tablets as well as Mac/PC/Linux computers. Visit music-group.com to download the Mac/PC/Linux software. The tablet software can be downloaded from the application store on your device.

4.5 Getting Started

First Wifi remote connection to your M AIR mixer

- Download and install the remote control app for your device.
 - Android smartphones/tablets: M AIR Android from the Google Play* store
 - iPad: M AIR for iPad from the App Store*
 - PC: M AIR EDIT for Windows, Mac or Linux from midasconsoles.com
- Set the REMOTE switch on your M AIR mixer to ACCESS POINT mode and power on the mixer.
- Reset your M AIR mixer's network settings to default values by holding the RESET button for 2 seconds. This is located in the small hole above the Wifi icon and requires a paper clip or similar tool to reach.
- Switch your remote control device on and open the network settings.

Android smartphones/tablets:

- Start the Settings/Wireless & Networks dialog on your Android system.
- Switch 'Wifi' on.
- Click on 'Wifi' to select a network. From the list of networks, select your M AIR mixer's name, e.g. "MR18-19-1B-07". After a few seconds, the status should change to 'Connected'.
- Open your M AIR for Android app and it will show similar information:
 - Mix Access = All
 - IP Address = 192.168.1.1
 - Wifi Lock = None
 - Wifi connected to MR18-19-1B-07
- You may choose to lock the connection to this specific Wifi network if you want to ensure that your device cannot automatically connect to another network while you are controlling your mixer.
- Click on 'Connect' and tap on the mixer's name in order to connect the app with your mixer. Note - if a warning pops up telling you that the mixer firmware is not supported, it is recommended to update the firmware to the latest version (see the product page on midasconsoles.com for details). You can, however, choose to connect anyway.
- Once the app is connected to your mixer, all parameters will be loaded automatically. Enjoy exploring all mixing functions of your M AIR mixer remotely!

iPad:

- Start the Settings/Wifi dialog on your iOS.
- Switch 'Wifi' on.
- Select your M AIR mixer's name from the list of networks, e.g. "MR18-19-1B-07". After a couple of seconds, the status should change to 'Connected', indicated by a check mark.
- Open your M AIR for iPad app and it will show any M AIR mixers ('Devices') found in that network, with their IP address, which in this case is 192.168.1.1.
- Tap on the mixer's icon to connect the app with your mixer. Note - if a warning pops up telling you that the mixer firmware is not supported, it is recommended to update the firmware to the latest version (see the product page on midasconsoles.com for details). You can, however, choose to connect anyway.
- Once the app is connected to your mixer, all parameters will be loaded automatically. Enjoy exploring all mixing functions of your M AIR mixer remotely!

PC: M AIR EDIT for Windows, Mac or Linux

- Open the Wireless Network Connections dialog on your operating system.
- Make sure the 'WLAN' or 'Wifi' adapter is switched on.
- View the list of wireless networks and select your M AIR mixer's name, e.g. "MR18-19-1B-07". After a couple of seconds, the status should change to 'Connected', indicated by a check mark.
- Open your M AIR Editor for Mac/Win/Linux and click on 'Setup'. The list will show any M AIR mixers found in that network, with their name and IP address, which in this case is 192.168.1.1.
- Click on your mixer's name, e.g. "MR18-19-1B-07", and confirm to synchronize from mixer to PC in order to connect the app with your mixer. If a warning pops up telling you that the mixer firmware is not supported, it is recommended to update the firmware to the latest version (see the product page on midasconsoles.com for details). You can, however, choose to connect anyway.
- Once the app is connected to your mixer, all parameters will be transferred automatically. Enjoy exploring all mixing functions of your M AIR mixer remotely!

5. M AIR for iPad

The M AIR applications for iOS, Android and Mac/Win/Linux allow all of the physical controls and features normally found on analog mixers to be adjusted digitally, and also allow effects and routing to be fully adjusted, all from a remote location away from the input box. This results in a very compact, yet full-featured mixing solution that can be operated while moving about the venue or studio. This chapter will discuss the software's functionality on an iPad.

5.1 Main Screen

The main screen provides access to all 16 channel faders, Aux in, and FX send levels, as well as navigation to preamp controls, meters, FX slots and more. The channel strips can be swiped side to side to reveal all 21 faders, and the selected bus fader is always visible.

1. The Channel Strip control section gives a quick reference to the status of phantom power, aux send levels, pan, etc., but no adjustments are made directly on this screen. Touch anywhere inside a channel's top strip section to edit parameters.
2. Touch a channel's Solo button to send the channel to the solo bus. The button will light yellow to indicate that a channel has been soloed.
3. Each channel has a dedicated meter to monitor the input level. If the meter reaches the red clip lights, lower the gain control on the Input screen (5.2).
4. The Channel Fader adjusts a channel's level, or adjusts the aux/FX send level, depending on which layer is selected on the right-hand side (see callout 11).
5. Touch a channel's Mute button to mute the channel. The button will light red when muted.
6. The Meters, Shows, Snapshots, Effects, Routing and Setup buttons allow direct access to these menus.
7. Engage the auto mix groups with these buttons. See section 5.9 for details.
8. Engage one of the 4 Mute Groups with these buttons. Assignments can be made by navigating to a channel's Output tab.
9. The Layers menu lets you select which channels/buses are visible on the main screen. Custom layers can also be created and edited, for example, to access only the drum channels.
10. The Solo Clear button releases all soloed channels.
11. The Fader Bank buttons alter the function of the channel faders. When set to Main, the faders adjust the channel volume levels sent to the main bus, and the overall main output. When one of the Aux or Effect buttons are selected, the faders adjust each channel's send level to that bus for monitoring or effects routing. The level for the Aux or Effect bus that is currently selected can be adjusted where the main fader normally appears.

5.2 Input

The Input section allows adjustment of the most common preamp parameters such as gain and phantom power. This is accessed by pressing the top of the Channel Strip of the channel you wish to modify. If another menu such as Sends or Gate come up instead, the menus can be swiped side-to-side without returning to the Main Screen.

1. The Link button allows adjacent channels to be linked as a stereo pair. Moving one of the linked channels' fader will also adjust the other channel.
2. The Phase button inverts the phase.
3. Use the Mic/USB switch to determine whether the channel is fed by the microphone input or by a signal from a DAW via the multi-channel USB connection.
4. The Mic Gain knob adjusts the input gain for the currently selected channel's mic preamp.
5. The USB Trim knob adjusts the digital trim for the signal coming from the connected computer. The Mic/USB switch must be set to USB.
6. The HPF Freq knob adjusts the frequency of the filter, allowing unwanted low frequencies to be removed.
7. Engage the HPF (high-pass filter) with this switch.
8. Press this button to engage the phantom power. It is best practice to engage phantom power before running audio in a channel, allowing all voltages to stabilize and prevent any noise during the performance.

5.3 Sends

The Sends tab allows the currently selected channel's signal to be routed to the 6 Aux outputs and to the 4 Effects processors. Aux and Effects routing can also be adjusted using the fader banks on the right-hand side of the screen.

5.4 Gate

The Gate tab allows a noise gate to be engaged and adjusted to remove unwanted noise. To accommodate various levels of mixing expertise, a standard or advanced screen can be selected. The standard view offers 4 presets and a threshold adjustment, while the advanced view allows fine adjustment of the gate parameters.

1. Engage the gate with the on/off button.
2. Adjust the Threshold that the audio must reach in order to bypass the gate. Any audio that does not register beyond the threshold setting will be muted automatically.
3. Press this button to open the preset list where your settings can be saved and recalled.

1. Engage the gate with the on/off button.
2. Gate Type buttons allow various types of gates to be selected. The EXP2, 3 and 4 settings reduce the output by varying amounts, allowing a natural-sounding reduction of signals that don't reach the selected threshold. The Gate setting enables a more aggressive drop in volume for signals below the threshold. An additional Range parameter adjusts the amount of attenuation. The Ducker setting attenuates the signal by a predetermined amount whenever the signal rises beyond the selected threshold. The Range parameter adjusts the amount of attenuation for this setting as well.
3. Adjust the Threshold that the audio must reach in order to bypass the gate or engage the Ducker.
4. The Range parameter adjusts the amount of signal attenuation for the Gate and Ducker settings.
5. Adjust the Attack knob to set how quickly the gate takes effect when the input signal drops below the threshold.
6. Adjust the Hold knob to set how long the input signal must surpass the threshold before bypassing the gate.
7. Adjust the Release knob to set how quickly the gate releases after the audio rises above the threshold.
8. Engage the Key Filter with the on/off button.

9. Select a high-pass, low-pass or mid peak frequency and slope for the key filter. The specific frequency can be selected by dragging the line across the frequency chart.
10. Press the Advanced button to select between normal and advanced gate operation.
11. Access the Key Filter parameters by pressing this button.
12. Select a source for the key filter.

5.5 Dynamics

A channel's dynamics can be adjusted on this page. A compressor is useful for reducing the dynamic range of a signal, allowing the perceived volume in the mix to be raised without clipping. An expander can add dynamics by attenuating a signal when it drops below the predetermined threshold.

1. Engage the compressor with the on/off button.
2. Adjust the Threshold at which the compressor begins to take effect. Audio that falls below this setting will remain unaffected.
3. Press this button to open the preset list where your settings can be saved and recalled.

1. Engage the dynamics processor with the on/off button.
2. Adjust the Threshold at which the compressor begins to take effect. Audio that falls below this setting will remain unaffected.
3. Adjust the Knee to allow the compressor to have a more gradual effect on the signal. When the Knee is set fully to the left (hard knee), any signals that rise above the threshold will receive the full compression ratio right away.
4. Select between a compressor or expander to set the action of the dynamics processor.
5. Adjust the Ratio to determine how aggressively the dynamics are affected.
6. The Wet/Dry ratio determines how much of the signal is left unaffected by the processor.

7. Use the Gain fader to compensate for changes in level caused by the processor.
8. Engage the Key Filter with the on/off button.
9. Select between an aggressive Linear or smooth Logarithmic operation, and between Peak or RMS input response. RMS is most common in compressors, and responds to the average level of incoming audio, whereas the Peak setting responds to brief spikes in loudness that would be allowed through when set to RMS.
10. Access the Key Filter parameters by pressing this button.
11. Adjust the Attack knob to set how quickly the compressor takes effect when the input signal rises above the threshold.
12. Adjust the Hold knob to set how long the compressor takes to enter the release cycle once the audio drops below the threshold.
13. Adjust the Release knob to set how quickly the compressor releases after the audio drops below the threshold.
14. Press the Auto button to allow the compressor to automatically set several advanced parameters based on the input signal.
15. Select a high-pass, low-pass or mid peak frequency and slope for the key filter. The specific frequency can be selected by dragging the line across the frequency chart.
16. Select a source for the key filter.

5.6 Channel EQ

1. Select the type of EQ for each of the 4 bands. Typically cut or shelf EQs are used for the highs and lows, whereas PEQ (parametric) and VEQ (vintage) are used for the mid range adjustments.
2. Use the Gain knob to adjust the desired boost or cut to the selected frequency.
3. Adjust the Width (Q) to determine how wide or narrow the frequency adjustment will be.
4. Use the Freq(ue)ncy knob to select the center frequency for PEQ and VEQ types, and the starting frequency for cut or shelf EQs.
5. Engage the EQ with the on/off button.
6. Press this button to open the preset list where your settings can be saved and recalled.
7. Press one of the band buttons to select the band. Drag the button left/right to set the frequency, and up/down to set the boost or cut. The desired band must be selected before adjusting the width parameter.
8. Engage the RTA (real time analyzer) with this button. The RTA is pre-EQ by default, but can be adjusted on the Setup - Audio/MIDI page.
9. Press this button to reset the currently-selected band.

5.7 Insert

Press the folder icon to engage the insert effect. Scroll through the list of effects blocks to select the desired routing.

5.8 Presets

The Presets tab allows channel presets to be recalled, edited and saved. Press the page icon on the right to save a new preset. Press the pencil icon to edit or delete a preset, and press on one of the saved presets to save changes or load that preset. Note that the Snapshots function also works for saving and recalling specific elements.

5.9 Output

1. Adjust the panorama in the stereo field.
2. The channel can be unassigned from the main LR outputs, which is useful to ensure that click tracks or talkback mics are not heard by the audience.
3. Assign the current channel to one of the DCA or Mute groups. When assigned to a DCA, the associated group number will appear just above the channel fader. When assigned to a Mute Group, the corresponding red box beneath the channel's fader will light up.
4. The Auto Mix function is very useful for meetings or panel discussions where multiple microphones are used for speech. The mic channels can be assigned to one of two auto mix groups, which will automatically attenuate the channels that are not currently receiving signal. Select the X or Y auto mix buttons in the Output tab to assign several channels to an auto mix group.

Whenever an auto mix bus is engaged, a blue gain reduction meter will indicate the amount of signal reduction for any channels assigned to the bus. This allows the current speaker to be heard clearly while suppressing any noise from the other microphones. In each channel's Output tab, a Weight control is included which allows certain channels to be attenuated more or less to compensate for louder voices or more sensitive microphones.

5.10 Meters

The Meters page is accessed via the icon at the top of the main screen. This page allows easy monitoring of all analog and digital levels, including USB channels, Gate and Dynamics activity, P-16 channels and the Main and Solo buses.

5.11 Shows

The Shows page allows performances to be saved on the iPad for various venues, artists, sets and arrangements for later recall. Within those shows, individual snapshots can be saved, edited and recalled. Press the page icon to save a new show or snapshot. Press the pencil icon to edit or delete a saved show or snapshot. Pressing on a show or snapshot will allow any changes to be saved, or for a new snapshot to be loaded.

5.12 Snapshots

The snapshot function allows the current state to be saved inside the mixer for immediate recall. The complete mixer state will be stored into one of the 64 internal snapshots. Every snapshot has a set of buttons allowing a specific subset of information to be filtered during recall. This allows certain channels or parameters to be enabled or disabled before a snapshot is loaded.

The snapshot recall parameters are listed in 3 categories: channel, parameter and global.

The Channel Section lets you determine which channels or bus masters will be affected during recall.

The Parameter Section lets you determine which specific preamp elements will be recalled for the channels and buses selected in the Channel Section above. Source affects the input vs. USB selection, Input recalls basic preamp settings such as phantom and gain setting, and Config recalls channel elements such as name, color, stereo link, low cut, and insert on/off. EQ, Dyn, Fdr/Pan and Mute recall these settings for the selected channels, and the bus/FX sends can be individually assigned for recall.

Global Settings allow the input/output routing to be recalled, as well as saving DCA assignments and FX block settings. The Global Config selection saves parameters such as link preferences, channel and bus links, solo preferences, Auto Mix enable and last gate open, and mute groups 1-4 on/off state.

The snapshot page displays a list of parameters that are armed for recall.

Press the Edit Scope button to select individual channels/parameters that will

be recalled from a previously saved snapshot. Press the 'All' button to choose everything in a category. There may be channels, buses, parameters, etc. that should remain unaffected throughout an event, so this method is beneficial for its highly specific method of recall.

To save a snapshot, press the Save button and confirm the save location. A new entry will appear in the list, and you can use the pencil icon to edit the name.

To recall a previously-saved snapshot, select the item in the list and then press the Load button.

To delete a snapshot that is no longer necessary, select it from the list and then select Delete.

5.13 Effects

The Effects page is accessed via the icon at the top of the main screen. There are 4 slots where various effects can be selected and adjusted to suit the application. Press the folder icon to activate an effect block. Press Edit to select a different effect, and press on the effect graphic to edit parameters. See the Effects Descriptions chapter for more details.

5.14 Routing

The Routing page allows the analog and digital inputs and outputs to be reassigned to different destinations. Select the group of inputs or outputs you want to edit from the top row, then press the block to which you want to reassign a channel.

5.15 Setup

The Setup page is accessed via the icon at the top of the main screen. This allows the channel layout to be modified, a console reset, and network settings to be adjusted.

For situations when one person is speaking for extended periods of time, the Last Gate function may be helpful to keep the most recently active channel open, preventing unwanted artifacts of the gate opening and closing during pauses in speech.

The console defaults to “soft mutes”, meaning that if a channel has been specifically muted, and is also a part of a mute group, when the mute group is unmuted, the channel that was specifically muted will also be unmuted.

Selecting Hard Mutes will cause a channel that has been muted with its dedicated Mute button will remain muted even if a mute group to which it belongs is unmuted. DCA Groups normally just control volume levels without actually having audio routing through them. However, engaging DCA Groups in the Mute System will enable channels to be muted via DCA group assignments.

To reset the mixer factory settings, press the Initialize Mixer button, then press Yes to confirm.

This screen allows the configuration of your wireless network connection. See the Network Connection chapter for details.

The Layers list, also found on the right-hand side of the main screen, lets you select which channels/buses are visible on the main screen. Custom layers can also be created and edited, for example, to access only the drum channels.

The scribble strips are also edited on this page. Press a channel's blank box to assign a color and name for that channel. The buses and effect blocks can also be edited.

The Audio/MIDI tab allows global settings for audio, MIDI and monitor options.

The console operates at 48 kHz by default, but can be changed to 44.1 kHz. The RTA can be switched from pre to post-EQ to monitor the effect of EQ adjustments. Engage the 'Mute at Power On' function to avoid pops during start up. When the Link option is selected, adjacent channels are paired together. Aside from the fader settings being matched, the preamp, dynamics, EQ and fader/mute/sends can also be aligned.

Activate the desired MIDI transmit and receive options for the physical MIDI ports and the USB MIDI in the menu.

The solo options can be selected in the monitor section. Channels and buses can be set to pre or after fader listen, and the solo bus level, trim and dimmer attenuation can all be set.

5.16 Main EQ

There are 3 EQ options for the main and monitor buses: 6-band parametric, graphic, and “true” EQ. These are accessed by pressing the PEQ/GEQ/TEQ buttons on the right side.

This parametric EQ functions the same as the channel EQ, but there are 6 bands available.

The GEQ and TEQ types appear to be identical, but the “true” EQ compensates for adjacent frequency adjustments. Most graphic equalizers have a multiplying effect when several neighboring bands are boosted or cut, causing an exaggerated EQ adjustment. The TEQ will have an EQ curve that is more indicative of the actual adjustments made on the sliders.

6. M AIR for Android

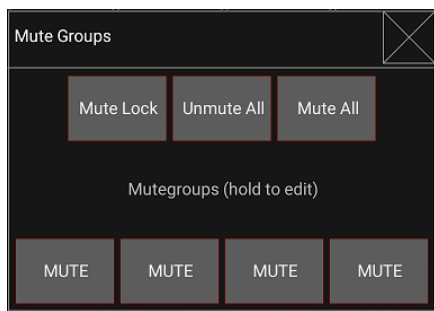

The M AIR applications for iOS, Android and Mac/Win/Linux allow all of the physical controls and features normally found on analog mixers to be adjusted digitally, and also allow effects and routing to be fully adjusted, all from a remote location away from the input box. This results in a very compact, yet full-featured mixing solution that can be operated while moving about the venue or studio. This chapter will discuss the software's functionality on an Android device.

6.1 Main View

The Main View screen provides access to all 16 channel faders, Aux in, and FX and bus levels, as well as navigation to preamp controls, meters, FX slots and more.

1. The Channel Strip gives quick reference to the status of various preamp settings, and allows access to Gate, Dynamics, EQ, Pan and Input controls.
 2. Touch a channel's Solo button to send the channel to the solo bus. The corner of the button will light yellow to indicate that a channel has been soloed.
 3. Each channel has a dedicated meter to monitor the input level. If the meter reaches the red clip lights, lower the gain control on the Input screen.
 4. The Channel Fader adjusts a channel's level, or adjusts the aux/FX/bus send level, depending on which layer is selected on the right-hand side.
 5. Touch a channel's Mute button to mute the channel. The button will light red when muted.
 6. Access the Meters, Effect Rack, Snapshots, Show/Scene, Routing and Setup pages by touching these buttons.
 7. Engaging the Fine button causes the faders to be adjusted in smaller increments, allowing more precise control.
 8. Select a channel bank 1-8 or 9-16 with these buttons.
- Note: all fader layers can be edited and new layers can be created for a customized mixing arrangement. See '6.14 Setup - Layers' for details.
9. Access the Mute Group edit screen by pressing the Mutes button:

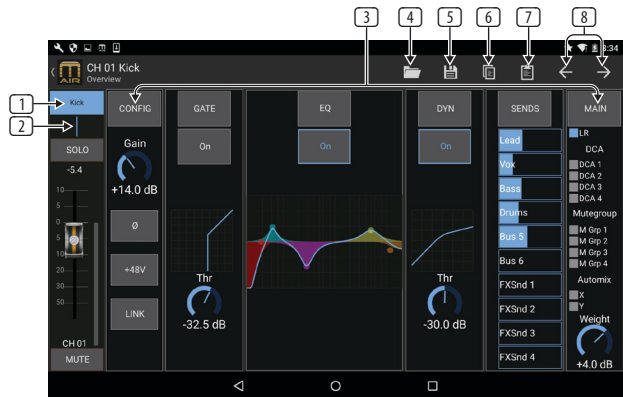

Engage the Mute Lock button to prevent accidental muting of individual channels. Mute All and Unmute All are quick ways to fully mute or unmute all sources. Tap one of the 4 Mute Group buttons to mute the channels assigned to that group, and hold one of the buttons to edit which channels are assigned to the group.

10. Access the Aux and FX return faders with this button.
11. Activate the Sends on Faders function with this button. When active, the faders control the bus send levels for the currently active bus (see callout 13). Moving between the channel and Aux/FX layers allows the sends for those layers to be adjusted as well.
12. Access the bus master faders with this button. Note that these will not be visible when the Sends on Faders function is active.

13. When using the Sends on Faders function, the bus to which the channel signals are sent is selected with the button directly below the Sends on Faders button. Pressing the Bus Master button will allow the send level for the selected bus to be adjusted.
14. Access the FX Send and Main LR faders with this button.

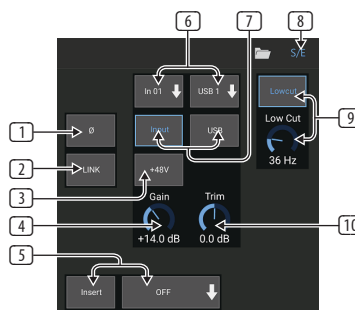

6.2 Input

The Input section allows adjustment of the most common preamp parameters such as gain, phase and phantom power. This is accessed from the Main View screen by pressing just above the Solo button in the channel strip area. By default, each channel will have a generic name such as "Ch 01" or "Bus 1", but this can be customized in this section.

1. Touch this top button to access the Scribble Strip page where a custom name and color can be selected.
2. Adjust the Pan by touching this button.
3. The on/off status and basic parameters for several preamp features can be adjusted on this page. To edit in detail, press Config, Gate, EQ, etc.
4. Many preamp functions have factory settings that can be accessed from the folder icon.
5. Current settings can be saved for later recall.
6. Press this button to copy the current settings.
7. Press this button to paste the recently-copied settings from one channel to another.
8. Skip to the previous or next channel with the arrow buttons.

6.3 Config

1. Invert the phase with this button.
2. Press the Link button to link the adjacent channel for stereo operation.

- Engage the 48 V phantom power by pressing and holding this button. It is best practice to engage phantom power before running audio in a channel, allowing all voltages to stabilize and prevent any noise during the performance.
- Adjust the analog input Gain with this control.
- Engage an effect Insert and select the FX bus that will be inserted.
- The source for the channel's physical input and USB input can be selected with these pull-down menus.
- Select whether the analog input or USB input appears at this channel.
- The S/E button appears at the top of many edit pages, and offers the option to view a simple or expanded set of controls, especially for the Gate and Dynamics pages.
- Engage the Low Cut with this button to remove unwanted low frequencies.
- Adjust the digital Trim for the USB input with this control.

6.4 Gate

The Gate tab allows a noise gate to be engaged and adjusted to remove unwanted noise. Using the S/E button, a simple or expanded set of parameters can be selected to accommodate various levels of mixing expertise. Presets can also be selected from the folder icon to automatically load settings that suit your application.

- Engage the gate with the ON button.
- The function menu allows various types of gates to be selected. The EXP, 2, 3 and 4 settings expand the dynamics by attenuating signals below the threshold by factors of 2:1, 3:1 and 4:1 respectively. The Gate setting completely cuts off signals below the threshold. The Ducker setting attenuates the signal by a predetermined amount whenever the signal rises beyond the selected threshold. This effect is usually controlled by an external key source, such as another channel's signal. Change the key source from "self" to any other channel (see callout #9).
- Adjust the Threshold that the audio must reach in order to bypass the gate or engage the Ducker.
- The Range parameter adjusts the amount of attenuation for the Gate and Ducker.
- Adjust the Attack knob to set how quickly the gate takes effect when the input signal drops below the threshold.
- Adjust the Hold knob to set how long the input signal must surpass the threshold before bypassing the gate.
- Adjust the Release knob to set how quickly the gate releases after the audio rises above the threshold.
- Engage the key filter with the Key On button.
- Select a low cut, high cut or mid peak frequency and bandwidth/slope for filtering the key signal that is controlling the gate. The key source is usually set to "self". Choosing a different key source allows another channel or bus to control the gate, e.g. for ducking the hi-hat channel whenever the snare drum is hit.

- Select the frequency for the key filter.

6.5 EQ

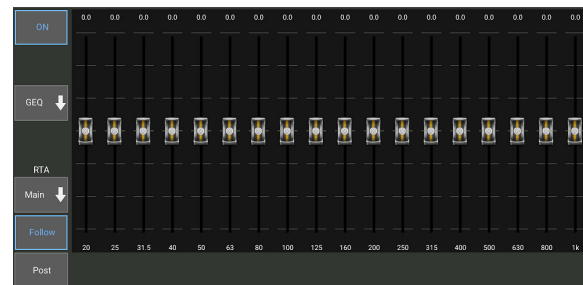

- Engage the EQ with the ON button.
- Engage the Lowcut button to remove unwanted low frequencies.
- Select the type of EQ for the selected band. This menu will only be available when one of the 4 bands are active, not including the lowcut.

- Drag the band button left and right to determine the specific frequency, and move it up and down to determine the amount of boost or cut. Use a pinch or spread gesture (zoom in/out) to alter the bandwidth/Q.
- Select the source for the RTA to display.
- To automatically send the channel that you are currently editing to the RTA, press the Follow button.
- Press the Post button to display the post-EQ results in the RTA.

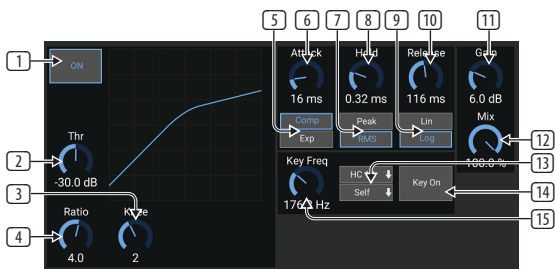

Graphic EQ

There are 3 EQ options for the Main LR and Aux buses: 6-band parametric, graphic, and “true” EQ. The parametric EQ functions the same as the channel EQ, only with 6 bands available. The GEQ and TEQ types appear to be identical, but the “true” EQ compensates for adjacent frequency adjustments. Most graphic equalizers have a multiplying effect when several neighboring bands are boosted or cut, causing an exaggerated EQ adjustment. The TEQ will have an EQ curve that is more indicative of the actual adjustments made on the sliders.

6.6 Dynamics

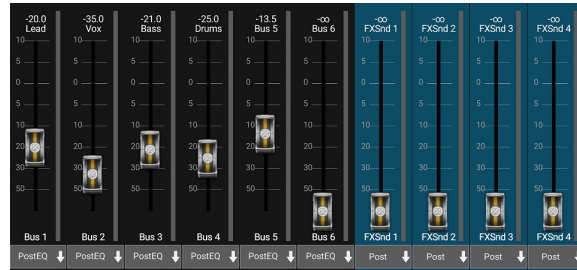

A channel’s dynamics can be adjusted on this page. A compressor is useful for reducing the dynamic range of a signal, allowing the perceived volume in the mix to be raised without clipping. An expander can add dynamics by attenuating a signal when it drops below the predetermined threshold. Using the S/E button, a simple or expanded set of parameters can be selected to accommodate various levels of mixing expertise.

1. Engage the processor with the ON button.
2. Adjust the Threshold at which the compressor begins to take effect. Audio that falls below this setting will remain unaffected.
3. Adjust the Knee to allow the compressor to have a more gradual effect on the signal. When the Knee is set fully to the left (hard knee), any signals that rise above the threshold will receive the full compression ratio right away.
4. Adjust the Ratio to determine how aggressively the dynamics are affected.
5. Select between a compressor or expander to set the action of the dynamics processor. While a compressor reduces a signal’s dynamics, an expander increases the dynamic range.
6. Adjust the Attack knob to set how quickly the compressor takes effect when the input signal rises above the threshold.
7. Select between Peak or RMS input response. RMS is most common in compressors, and responds to the average level of incoming audio, whereas the Peak setting responds to brief spikes in loudness that would be allowed through when set to RMS.
8. Adjust the Hold knob to set how long the compressor takes to enter the release cycle once the audio drops below the threshold.
9. Select between an aggressive Linear or smooth Logarithmic operation.
10. Adjust the Release knob to set how quickly the compressor releases after the audio drops below the threshold.
11. Use the Gain knob to compensate for changes in level caused by the processor.
12. Adjust the Mix knob to determine how much of the signal is left unaffected by the processor.
13. Select a high cut, low cut or mid peak frequency and bandwidth/slope for the key filter.
14. Engage the key filter with the Key On button.

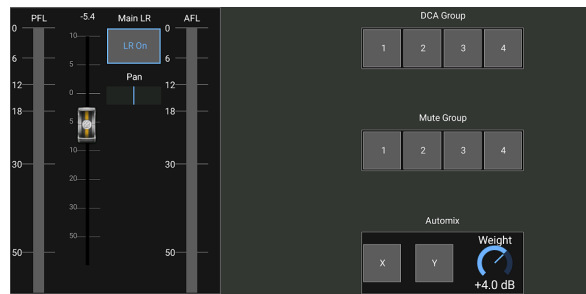

15. Select the filter frequency and source for the key signal. In most applications, a channel’s own signal, i.e. “self”, will be used to trigger the compressor. However, when a channel shall be compressed from another signal, e.g. a subgroup compressor controlled from the bass drum signal, this can be achieved by selecting the other channel as the key source.

6.7 Sends

The Sends screen allows the currently selected channel’s signal to be routed to the 6 Aux outputs and to the 4 Effects processors. Aux and Effects routing can also be adjusted using the fader banks on the right-hand side of the Main View screen. The signal can be routed to the buses from specific points in the preamp chain, such as pre or post EQ (the S/E button must be active).

6.8 Main

When the LR On button is active, the channel is assigned to the main bus. For sources that are not intended for the audience to hear, such as click tracks, removing the channel from the main bus eliminates the potential to accidentally mix that source into the mains. The channel’s pan can also be adjusted here, and both pre-fader and after-fader listen meters can be monitored.

This page also allows the channel to be quickly assigned to a DCA, Mute Group or Automix group.

The Auto Mix function is very useful for meetings or panel discussions where multiple microphones are used for speech. The mic channels can be assigned to one of two auto mix groups, which will automatically attenuate the channels that are not currently receiving signal. Click the X or Y auto mix buttons in the Main tab to assign several channels to an auto mix group.

Navigate to the Setup - Preferences tab and engage the Show button under Automix. This will cause an Automix X and Y button to appear on the Main View screen.

Whenever an auto mix bus is engaged, a blue gain reduction meter will indicate the amount of signal reduction for any channels assigned to the bus. This allows the current speaker to be heard clearly while suppressing any noise from the other microphones. In each channel’s Main tab, a Weight knob is included which allows certain channels to be attenuated more or less to compensate for louder voices or more sensitive microphones.

6.9 Meters and RTA

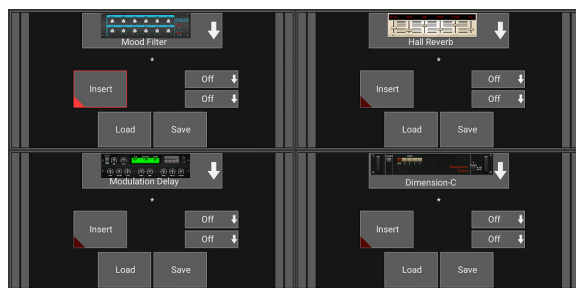

The Meters tab allows easy monitoring of all analog and digital levels, including USB channels, Buses, Ultramet outputs, and the Main and Solo buses.

RTA

The RTA (real time analyzer) allows constant visual frequency feedback of the selected source. The RTA Source pull-down menu allows a specific channel or bus to be fixed to the RTA, and the signal can be tapped pre or post EQ. The Decay adjustment controls how quickly the frequency bands fall after reaching their initial indication. Select Peak to monitor the rapid changes in frequency response, or RMS to view an average response over a longer period of time.

6.10 Effect Rack

The Effect Rack page is accessed via the “FX” icon at the top of the Main View screen. There are 4 slots where various effects can be selected and adjusted to suit the application. Tap on the effect slot to select an effect and adjust the available parameters.

6.11 Snapshots

The snapshot function allows the current state to be saved inside the mixer for immediate recall. The complete mixer state will be stored into one of the 64 internal snapshots. Every snapshot has a set of buttons allowing a specific subset of information to be filtered during recall. This allows certain channels or parameters to be enabled or disabled before a snapshot is loaded.

01 first snapshot	Channel Selection			Parameter Selection				Global Settings
02	CH 01	CH 11	Bus 1	Source	Bus Snd 1		In/Out	
03	CH 02	CH 12	Bus 2	Input	Bus Snd 2		Config	
04	CH 03	CH 13	Bus 3	Config	Bus Snd 3		DCA 1	
05	CH 04	CH 14	Bus 4	EQ	Bus Snd 4		DCA 2	
06	CH 05	CH 15	Bus 5	Dyn	Bus Snd 5		DCA 3	
07	CH 06	CH 16	Bus 6	Fdr/Pan	Bus Snd 6		DCA 4	
08	CH 07	Line In	FXSnd 1	Mute	FX Snd 1		FX Slot 1	
09	CH 08	Rtn 1	FXSnd 2		FX Snd 2		FX Slot 2	
10	CH 09	Rtn 2	FXSnd 3		FX Snd 3		FX Slot 3	
11	CH 10	Rtn 3	FXSnd 4		FX Snd 4		FX Slot 4	
12		Rtn 4	LR					

Click the camera icon at the top of the main screen. A window will open with a list of parameters to select for recall. You can select individual channels/parameters that will be recalled from a previously saved snapshot, or click the ‘All’ button to choose everything in a category. There may be channels, buses, parameters, etc. that should remain unaffected throughout an event, so this method is beneficial for its highly specific method of recall.

To save a snapshot, press and hold one of the slots in the left-hand list. A new entry will appear in the list where you can type in a name for the new snapshot. To recall a previously-saved snapshot, press and hold the item in the list and then select the Load option. Note that all aspects of the current arrangement will be saved to a new snapshot slot, and the specific elements of that snapshot can be selected upon recall.

The snapshot recall parameters are listed in 3 categories: channel, parameter and global.

The Channel Section lets you determine which channels or bus masters will be affected during recall.

The Parameter Section lets you determine which specific preamp elements will be recalled for the channels and buses selected in the Channel Section above. Source affects the input vs. USB selection, Input recalls basic preamp settings such as phantom and gain setting, and Config recalls channel elements such as name, color, stereo link, low cut, and insert on/off. EQ, Dyn, Fdr/Pan and Mute recall these settings for the selected channels, and the bus/FX sends can be individually assigned for recall.

Global Settings allow the input/output routing to be recalled, as well as saving DCA assignments and FX block settings. The Global Config selection saves parameters such as link preferences, channel and bus links, solo preferences, Auto Mix enable and last gate open, and mute groups 1-4 on/off state.

To delete a snapshot that is no longer necessary, press and hold the snapshot until the Load/Save/Delete box opens, then select Delete.

6.12 Scenes and Shows

Current show	Channel safes												
MyShow	Kick	Snare	Ride	Hats	Click	Track	Bass	Lead G	Acoustic	Vox 1	Vox 2	Vox 3	CH 13
	CH 14	CH 15	Ambient	Line In	Rtn 1	Rtn 2	Rtn 3	Rtn 4	Lead	Vox	Bass	Drums	Bus 5
	Bus 6	FXSnd 1	FXSnd 2	FXSnd 3	FXSnd 4	Main	DCA 1	DCA 2	DCA 3	DCA 4			

Scenes
New Scene

The Scenes/Shows page is accessed via the folder icon at the top of the Main View screen. This page allows you to save, edit and recall specific scenes from the active show that is stored on your Android device. To prevent certain channels or buses from being affected by scene or show recalls, arm the desired sources in the ‘Channel safes’ section.

Tapping SHOWS in the top right corner will open the show overview page, allowing you to load/save/edit/delete an existing show or create a new one.

6.13 Routing

The Routing menu is accessed via the up/down arrow icon at the top of the Main View screen. This allows the specific routing of input, output, USB and monitor buses to be adjusted freely.

Tap inside an empty box in the grid to move the orange dots and reassign the source for input channels, USB channels and P16 monitoring sources. Modifications to the Inputs/USB routing can be reset by pressing the revert button on the far right. The USB sends and inputs can be selected from a menu in the folder icon, or they can be moved manually.

The Routing – Outputs page allows the Main LR, Phones, Aux and P16 sources to be reassigned.

6.14 Setup

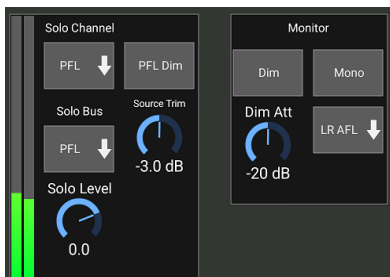

The Setup menu is accessed via the top right corner of the Main View screen. This allows access to several global settings, network configurations and layout features.

Preferences

The Preferences screen allows the auto mix X and Y buttons to be viewed on the Main View screen.

The Solo Channel and Solo Bus can operate in pre-fader or after-fader listen mode. The solo level can be adjusted if necessary as well. A PFL dimmer can be engaged and adjusted to cause a drop in volume whenever a pre-fader (PFL) signal is soloed, in order to match typical post fader (AFL) levels. The solo bus can operate in mono or stereo. The source and tap for monitoring can be selected from a pull-down menu. This monitor signal will be heard when no channels are soloed.

The Setup – Audio/MIDI page allows editing of MIDI receive (Rx) and transmit (Tx) settings, as well as several global system parameters.

The transmit, receive and OSC settings can be independently activated for the DIN connectors and USB MIDI. The console can also pass USB MIDI through the MIDI OUT connector.

The console defaults to “soft mutes”, meaning that if a channel has been specifically muted, and is also a part of a mute group, when the mute group is unmuted, the channel that was specifically muted will also be unmuted. Selecting Hard Mutes will cause a channel that has been muted with its dedicated Mute button will remain muted even if a mute group to which it belongs is unmuted. DCA Groups normally just control volume levels without actually having audio routing through them. However, engaging DCA Groups in the Mute System will enable channels to be muted via DCA group assignments.

The console can operate at 48 kHz or 44.1 kHz. Mute the main LR fader before changing clock rates as pops can occur.

The MR18 has an 18x18 channel USB audio interface built-in, which is useful for recording sessions. You may, however, choose to switch to 2x2 channel mode for simple media player applications when you don’t want to mess around with multiple USB audio streams in your host PC.

Click the Initialize button to reset all system parameters. All settings will be lost, so make sure to save any scenes or shows to a PC hard drive first.

When the Link option is selected in a channel's Config page, the adjacent channel is linked as a stereo pair. Aside from the fader settings being matched, the preamp, dynamics, EQ and fader/mute/sends can also be aligned, depending which items are activated at the bottom of the Audio/MIDI page.

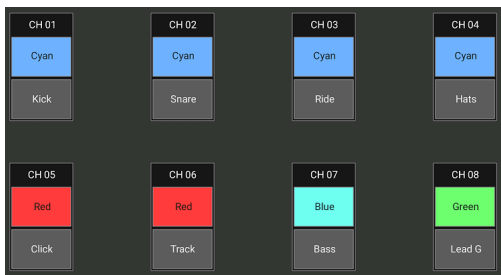

This screen allows the configuration of your wireless network connection. See the Network Connection chapter for details.

The Setup – Layers page allows the order of channels and buses to be altered. By default, only 8 channels are visible on the Main View screen at one time, but this can be edited to allow, for example, all 16 input channels to be seen at once. A new layer can also be created to contain a custom mix of inputs and buses. By increasing the visible channels per layer to 9, the Main LR fader could be added to all of the fader banks so it is always available for adjustment.

Custom layers can be saved and recalled later, and the layers can be restored to their default settings. The Setup menu also allows quick access to the Scribble Strips for changing channel names and colors.

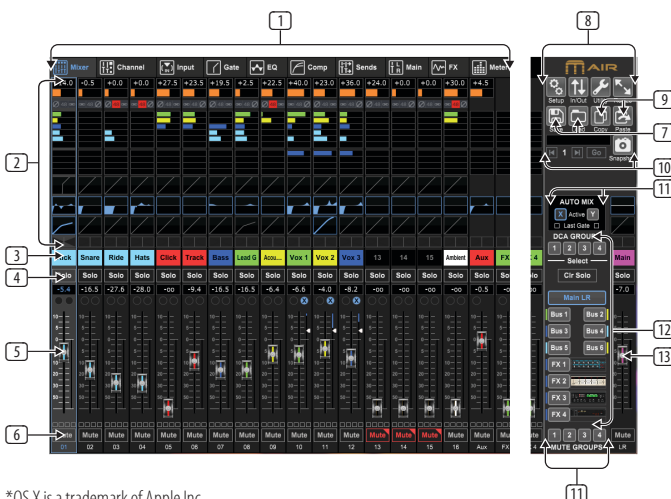

The Scribble Strip page allows a custom name and color to be assigned for each channel, bus, FX send/return, and DCA group.

7. M AIR Edit for PC

The M AIR applications for iOS, Android and Mac/Win/Linux allow all of the physical controls and features normally found on analog mixers to be adjusted digitally, and also allow effects and routing to be fully adjusted, all from a remote location away from the input box. This results in a very compact, yet full-featured mixing solution that can be operated while moving about the venue or studio. This chapter will discuss the software's functionality on a laptop/desktop running Windows, OS X* or Linux.

7.1 Main View and Mixer Tab

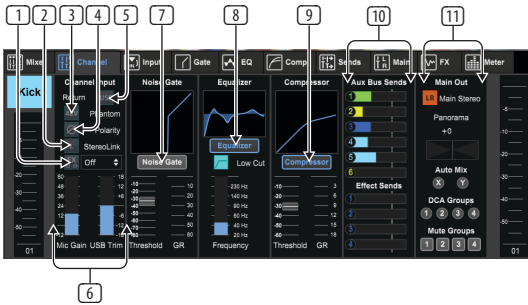

*OS X is a trademark of Apple Inc.

1. The Navigation Tabs allow quick access to various edit menus.
 2. The Channel Strip area gives a quick reference to the status of phantom power, aux send levels, pan, etc., The gain, aux levels, FX send levels and pan can be adjusted by clicking and dragging left or right inside the respective section. Click the Gate, EQ and Comp sections to jump to the edit pages for that channel.
- Note** – the following items are always visible regardless of which tab is selected:
3. Left-click the channel number to select that channel. Right-click to change the name and color of the channel.
 4. Touch a channel's Solo button to send the channel to the solo bus. The button will light orange to indicate that the channel has been soloed.
 5. The Channel Fader adjusts a channel's level, or adjusts the aux/FX send level, depending on which layer is selected on the right-hand side.
 6. Click a channel's Mute button to mute the channel. The button will light red when muted.
 7. Use the Save and Load icons to save and recall show scenes and saved channel settings.
 8. Access the Setup and Routing screens via the icons in the upper right corner. The Utility feature provides access to additional floating windows that provide constant access and monitoring for certain functions. See section 7.13 for details. The Resize button allows the window to automatically fit various screen resolutions up to 4k, as well as conform to a custom size.
 9. Use the Copy and Paste buttons to transfer information between channels. After clicking Paste, a window will open to allow a specific parameters to be selected.
 10. The Snapshot feature lets you save the current state of the mixer for later recall. The specific parameters that should be recalled can be determined at the time that a new snapshot is created, and can also be refined later before the snapshot is actually loaded. Dedicated controls allow the saved snapshots to be shuffled through and loaded directly from the main mixer view. See section 7.12 for details.
 11. Engage the Auto Mix X and Y buses here. See section 7.14 for details.
 12. The Fader Bank buttons determine which layer is active in the faders. When set to Main LR, the faders adjust the channel volume levels sent to the main bus, and the main output is adjusted with the far-right fader. When one of the bus or FX layers are selected, the faders adjust each channel's send level to that bus for monitoring or effects routing. The overall bus level is adjusted with the far-right fader. To assign a channel to a DCA, select the DCA group 1-4 and then click the small circle located above each channel fader that you want to assign to that group. The group number will be indicated in the circle.
 13. The main level fader adjusts the output of the currently-selected bus.
 14. The 4 Mute Group buttons engage the mute groups. Click one of the 4 small boxes below each channel fader to assign that channel to a particular mute group.

7.2 Channel Tab

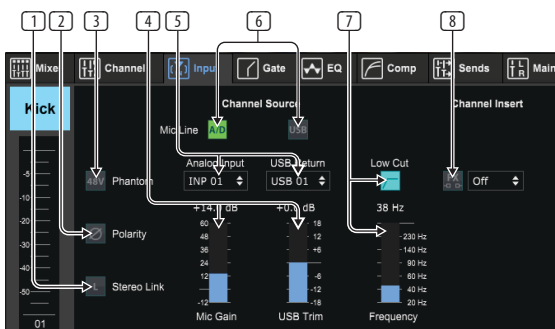

The Channel tab allows quick access to the most common preamp parameters, as well as basic control over the noise gate, compressor and bus sends. Most of the adjustments on this tab can also be found in greater detail on other tabs.

1. Click the FX button to engage an insert effect. The specific FX block is selected with the adjacent pull-down menu.
2. The Stereo Link button allows a channel to be paired with the adjacent channel in a stereo pair. The fader level, gain setting, bus sends, etc. will be the same between the 2 channels, and the pan will default to hard left and right. The odd-numbered channel will always be the lower of the pair. See chapter 7.11 for available link preferences on the Setup - Audio/MIDI page.
3. The Phantom button engages the 48 V phantom power for use with condenser microphones and active DI boxes.
4. The Polarity button inverts the phase.
5. Click the USB button to route the USB return signal to the selected channel instead of the analog input.
6. The analog Mic Gain and digital USB Trim can be adjusted independently, though only one source can be used at a time.
7. The Noise Gate can be engaged and the threshold can be adjusted from this page. More detailed controls are available on the Gate tab.
8. The Equalizer and Low Cut can be engaged here, as well as the low cut frequency.
9. The Compressor can be engaged and its threshold adjusted here. More detailed controls are available on the Comp tab.
10. The channel Aux Bus Sends can be adjusted here as well as the Sends tab.
11. The Main Out section allows the channel to be routed to or removed from the main bus. The pan can also be adjusted, and the Auto Mix, DCA Group and Mute Group assignments can be selected here as well.

7.3 Input Tab

The Input tab allows adjustment of the most common preamp parameters as well as specific routing for the input and insert.

1. The Stereo Link button allows a channel to be paired with the adjacent channel in a stereo pair. The fader level, gain setting, bus sends, etc. will be the same between the 2 channels, and the pan will default to hard left and right. The odd-numbered channel will always be the lower of the pair.
2. The Polarity button inverts the phase.

3. The Phantom button engages the 48 V phantom power for use with condenser microphones and active DI boxes. It is recommended to engage phantom power well ahead of running audio in a channel in order to allow all voltages to stabilize and prevent any noise during performance.
4. The analog Mic Gain and digital USB Trim can be adjusted independently, though only one source can be used at a time.
5. The analog input and USB input channels default to a 1:1 relationship to the channel number, but can be re-routed using the pull-down menus.
6. Select whether the analog mic/line input or the USB input appears in the channel.
7. Engage the Low Cut and adjust the specific frequency to remove unwanted lows.
8. Click the FX button to engage an insert effect. The specific FX block is selected with the adjacent pull-down menu.

7.4 Gate Tab

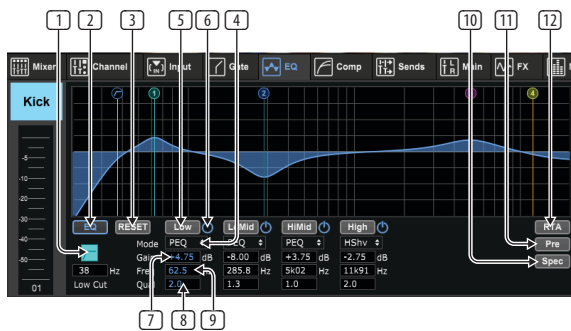

The Gate tab allows a noise gate to be engaged and adjusted to automatically remove unwanted noise.

1. Select one of the 4 Presets to automatically optimize the parameters for one of these common sources.
2. Engage the Noise Gate with this button.
3. Adjust the Threshold that the audio must reach in order to bypass the gate or engage the ducker.
4. The Range parameter adjusts the amount of signal attenuation for the Gate and Ducker settings.
5. Select the type of effect from the 5 options. Expander effects are available with 2:1, 3:1 and 4:1 ratios which reduce the output by varying amounts, allowing a natural sounding reduction of signals that don't reach the selected threshold. The Gate setting enables a more aggressive drop in volume for signals below the threshold. An additional Range parameter adjusts the amount of attenuation. The Ducker setting attenuates the signal by an adjustable amount whenever the signal rises beyond the selected threshold. The Range parameter adjusts the amount of attenuation for this setting as well.
6. Adjust the Attack parameter to set how quickly the gate opens up when the signal rises above the threshold.
7. Adjust the Hold parameter to set how long the gate will stay open after the signal drops below the threshold.
8. Adjust the Release parameter to set how quickly the gate will close after the hold time has ended.
9. Engage the key Filter with this button, which can be used to emphasize the specific frequency range that will open up the gate, or exclude certain frequencies that you do not want to affect the gate.

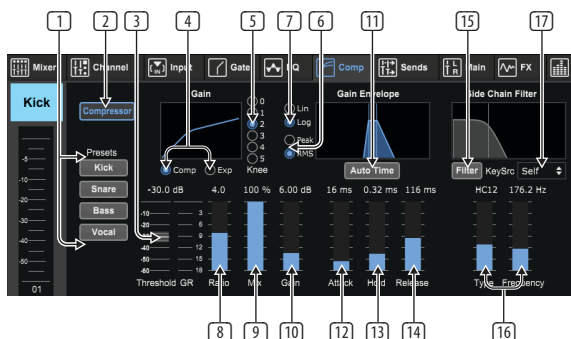

10. Select the type of filter and frequencies with these faders.
11. Select a channel or bus for the side chain from the pull-down menu. For the gate and expander functions, the key filter is usually set to "self", but the ducker can use another channel's signal to trigger the desired attenuation.

7.5 EQ Tab

1. Engage the Low Cut and adjust the specific frequency to remove unwanted lows.
2. Turn the equalizer on and off with the EQ button. If a bus output is selected, a graphic EQ can also be engaged with the options below the EQ button.
3. Use the Reset button to return all bands to their default settings. A confirmation box will pop up to prevent accidental resets.
4. Select the Mode from the pull-down menu. PEQ types will often be used for the first 3 bands, and a high cut or high shelf for the 4th band.
5. The currently-active band will be indicated on this button.
6. Click this button to turn a specific band on and off. This is useful for A/B testing how an adjustment affects the signal.
7. The gain adjustment for each band can be manually entered here, or you can click and drag the band's corresponding number up and down.
8. The bandwidth (Q) can be manually entered here. Alternatively, you can place the mouse over the numbered dot for an EQ band and change the bandwidth with the mouse wheel.
9. Each band's specific frequency can be manually entered, or you can click and drag the band's number to the desired frequency.
10. Engage the Spectrograph function to change from the standard RTA view to a spectrogram, which displays the signal energy over time. This can be useful for identifying feedback or phasing problems.
11. Press the Pre button to display the RTA pre-EQ rather than post-EQ.
12. Engage the RTA (Real Time Analyzer) with this button.

7.6 Comp Tab

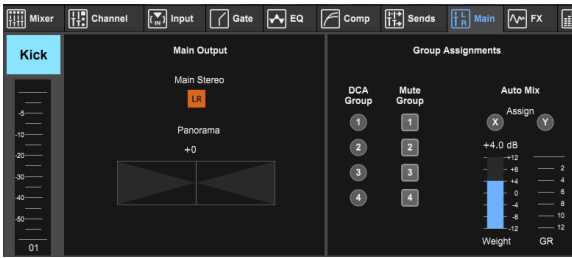

1. Select one of the 4 Presets to automatically optimize the parameters for one of these common sources.
2. Engage the Compressor with this button.
3. Adjust the Threshold at which the compressor begins to take effect. Audio that falls below this setting will remain unaffected.
4. Select between a Compressor or Expander to set the action of the dynamics processor. While a compressor reduces a signal's dynamics, an expander increases the dynamic range.
5. Select a Knee angle to set how gradual the compressor takes effect. When set to 0, any signals that rise above the threshold will receive the full compression ratio.
6. Select between Peak and RMS input response. RMS is most common in compressors and responds to the average level of incoming audio, whereas the Peak setting responds to brief spikes in loudness that would be allowed through when set to RMS.
7. Select between an aggressive Linear or smooth Logarithmic operation.
8. Adjust the Ratio to determine how aggressively the dynamics are affected.
9. Adjust the Mix to determine how much of the signal is left unaffected by the processor, commonly called parallel or "New York" compression.
10. Adjust the Gain to compensate for changes in level caused by the processor.
11. Engage the Auto Time to allow several of the more advanced parameters to be automatically adjusted according to the input signal.
12. Adjust the Attack to set how quickly the compressor takes effect when the input signal rises above the threshold.
13. Adjust the Hold to set how long the compressor takes to enter the release cycle once the audio drops below the threshold.
14. Adjust the Release to set how quickly the compressor releases after the audio drops below the threshold.
15. Engage the key Filter with this button.
16. Select the type of filter and frequencies with these faders.
17. Select a channel or bus for the side chain input from the pull-down menu. In most applications, a channel's own signal will be used to trigger the compressor, and therefore the key filter should be set to "self". However, a technique called "sidechain" compression can be achieved by selecting another channel as the key source.

7.7 Sends Tab

The Sends tab allows the currently-selected channel's signal to be routed to the 6 Aux buses and to the 4 FX processors. These adjustments can also be made on the Channel tab, or by selecting one of the Fader Bank layers on the lower right-hand side of the main view screen. The signal can be routed to the buses from specific points in the preamp chain, such as pre or post EQ and pre or post fader. Clicking the globe icon will enable changes to the tap point (pre/post fader, etc) to take effect on all channels.

7.8 Main Tab

All of the controls on the Main tab are also accessible from the Channel tab. The channel's signal can be unassigned from the main output, which is useful when recording sources that aren't meant to be heard by the audience, or for sources such as click tracks that are only meant for the performers' mixes and not the main speakers. The channel's pan control can be adjusted and DCA, Mute Group and Auto Mix assignments can be made as well.

Note - when applying groups processing to channels that are mixed on a subgroup, the input channels would be unassigned from the Main LR to ensure that only the processed subgroup is heard on Main LR.

7.9 FX Tab

The FX tab has 4 effect processors that can be routed and adjusted to various channels and buses. A new effect can be selected by clicking the pull-down menu where the current effect's name is displayed, or by clicking the Type button which also shows a graphic view of each effect. Once a desired effect is selected, click on the graphic to bring up the edit window where the specific parameters can be adjusted. If applicable, a tap tempo button is available to manually enter the rate of delays or choruses. The button will flash to indicate the tempo. Click the Insert button to engage the effect as an insert instead of side-chain. Select the channel or bus where the effect shall be inserted with the pull-down menu. See the Effects Overview chapter for more details.

7.10 Meter Tab

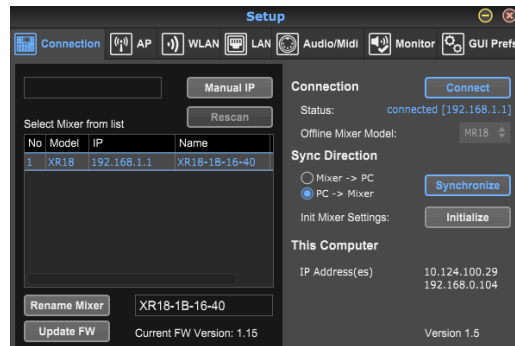

The Meter tab allows easy monitoring of all analog and digital levels, including USB channels, Buses, Ultraset outputs, and the Main and Solo buses. All meters show pre-fader levels except the Main LR which shows post fader signal level.

7.11 Setup Menu

The Setup menu allows the wireless connection to be configured and allows various global parameters to be selected and adjusted.

Connection Tab

After you connect your computer to the internal Access Point or external router, the software will likely automatically recognize the mixer and ask to connect. Once connected, a prompt will ask if you would like to transfer settings from the mixer to PC, or from the PC to the mixer. Synchronization is generally recommended to ensure proper parameter display, but you may also click 'cancel' if you don't want to sync settings. The Connection tab also allows you to manually enter an IP address for situations where a network router is blocking the broadcast from the app.

Note - save your settings to your computer's hard drive before updating the firmware!

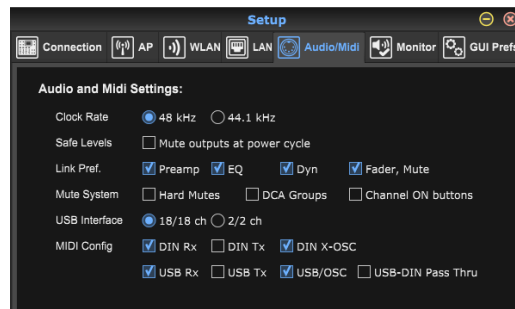

By default, a generic name, such as MR18-1B-10-F3, will be assigned to your mixer. This can be changed to something more specific and recognizable. The console can also be initialized back to its factory state, but be aware that all settings will be erased. We highly recommend using the Save function to store any important scenes to your computer's hard drive.

Access Point, WLAN, LAN Tabs

The Access Point, WLAN and LAN tabs allow the wireless connection to be configured. See the 'Network Connection' chapter for details.

Audio/MIDI Tab

The Audio/MIDI tab allows various global settings to be assigned. The console can operate at 48 kHz or 44.1 kHz. Mute the main LR fader before changing clock rates as pops can occur.

Engage the Safe Levels function to automatically mute the outputs during a power cycle. This is particularly useful for situations where the mixer is always connected to a PA system or monitoring setup.

The Link Preferences allow specific preamp elements to be synchronized when adjacent channels are linked.

The console defaults to “soft mutes”, meaning that if a channel has been specifically muted, and is also a part of a mute group, when the mute group is unmuted, the channel that was specifically muted will also be unmuted. Selecting Hard Mutes will cause a channel that has been muted with its dedicated Mute button will remain muted even if a mute group to which it belongs is unmuted. DCA Groups normally just control volume levels without actually having audio routing through them. However, engaging DCA Groups in the Mute System will enable channels to be muted via DCA group assignments.

The MR18 has an 18x18 channel interface built-in, but sometimes this is overkill for a recording session. For overdubs and simple tracking, the 2x2 interface is more efficient and easier on processing power.

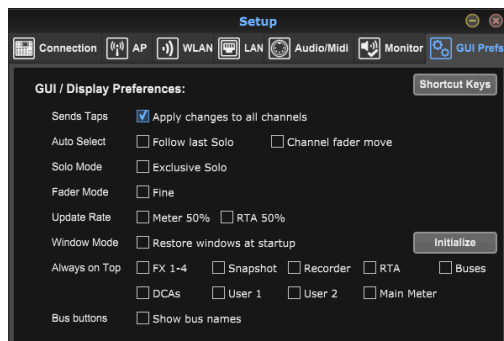

Various send (Tx) and receive (Rx) preferences are selectable for the MIDI configuration. Note that all MIDI Config parameters should be unchecked in order for the BEHRINGER X-TOUCH control surface to control the M AIR mixer via IP networks or MIDI.

Monitor Tab

The monitor source defaults to the main LR (post-fader), but you can select a bus, aux, USB 17/18 or a combination of buses. Soloed channels and buses can be monitored pre or post-fader. PFL attenuation can be engaged and the relative levels for monitor and source can be set. Click the DIM button to enable dimming and select the attenuation level. The monitor bus can be set to mono and can be muted from this page.

GUI Preferences Tab

Various preferences pertaining to the graphic user interface behavior can be made on this tab.

Select the ‘Apply changes to all channels’ option if you would like changes made to bus send taps (pre/post-EQ, etc) to be applied to all channels. This is also accessible in each channel Sends tab as the globe icon.

Auto Select options allow the last soloed channel to be selected automatically, and allow a channel to be automatically selected whenever its fader is adjusted.

Exclusive solo mode allows only one source to be soloed at a time. Pressing a channel’s Solo button will automatically un-solo previously soloed channels.

The ‘Fine’ fader mode allows adjustments to the faders to occur more gradually, allowing more precise control when making small changes.

The update rate defaults to 100%, meaning the meters and RTA display immediate feedback of the audio signals. However, this can be adjusted to 50%, which shows less detail but also conserves on processing power.

The configuration of the application’s windows can be stored and recalled upon launch. Click the Initialize button to clear the stored window configuration, useful in case some resizing operations have rendered windows inaccessible or moved off the screen.

Use the Always on Top selection to keep certain windows in view regardless of other windows being adjusted. Bus names can be shown on the main screen instead of ‘Bus 1’, ‘Bus 2’, etc.

7.12 Snapshot Page

The snapshot function allows specific bits of information to be saved for immediate recall. For example, quick changes can be selected for different acts of a play, performances in a music festival with several bands, or different church services.

Click the ‘Snapshots’ icon on the right hand side of the main screen. A window will open with a list of parameters to select for recall. You can select individual channels/parameters that will be recalled from a previously saved snapshot, or click the ‘All’ button to choose everything in a category. There may be channels, buses, parameters, etc. that should remain unaffected throughout an event, so this method is beneficial for its highly specific method of recall.

To save a snapshot, click one of the slots in the left-hand list. A new entry will appear in the list where you can type in a name for the new snapshot. Note that all aspects of the current arrangement will be saved to a new snapshot slot, and the specific elements of that snapshot can be selected upon recall.

The snapshots recall parameters are listed in 3 categories: channel, parameter and global.

The Channel Section lets you determine which channels or bus masters will be affected during recall.

The Parameter Section lets you determine which specific preamp elements will be recalled for the channels and buses selected in the Channel Section above. Source affects the input vs. USB selection, Input recalls basic preamp settings such as phantom and gain setting, and Config recalls the configuration. EQ, Dyn, Fdr/Pan and Mute recall these settings for the selected channels, and the bus/FX sends can be individually assigned for recall.

Global Settings allow the input/output routing to be recalled, as well as global configuration, DCA assignments, and FX block settings.

To delete a snapshot that is no longer necessary, select it from the list and click Delete.

7.13 Utilities

Utilities offer convenient editing and customization of items that are not easily controlled on other windows or menus.

Meter

A dedicated window is available to keep the main and monitor/solo levels in view regardless of the focus of the main screen.

RTA Utility

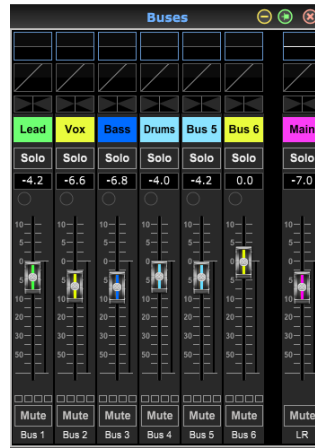

The RTA utility allows customization of the appearance and functionality of the real time analyzer. The RTA Source pull-down menu allows a specific channel or bus to be fixed to the RTA, or the RTA can follow the active channel. Select Solo Priority to send any soloed channel to the RTA.

The Decay adjustment controls how quickly the frequency bands fall after reaching their initial indication. Peak Hold will leave a small marker to indicate the peak measurement over a longer period of time while still monitoring the fine audio activity. RTA Gain compensates for audio levels, ensuring accurate readings. Select the Auto Gain feature to automatically select an appropriate RTA gain level. The EQ overlay adjustment controls the opacity of the RTA when viewing channel EQ curves. Select Spectrograph to view the audio energy across the spectrum, where blue represents lower levels and red indicates higher levels. Note that this only affects the RTA utility window and not the individual channel EQs.

Channel and Graphic EQs can be preassigned to have spectrograph RTAs, and can operate as pre or post-EQ. These selections can be overridden on the channel/bus EQ tab. Select the 'Use RTA Source' option if you want to view a source's RTA while adjusting another channel's EQ. This is useful for connecting a measurement mic to one of the input channels and selecting it as RTA source. The RTA displayed (for example, on the Main LR or Monitor output bus EQ) will now always use the actual room mic signal so that you can tune the system easily.

Select a 30 or 60 dB gain range, and pre or post EQ results. Select Peak to monitor the instantaneous changes in sound level, or RMS to view an approximated power spectrum that better corresponds to perceived levels.

Buses Utility

The Buses utility window gives convenient access to all of the channel strip functions of all 6 buses and the main LR at the same time. This window can be left open so that changes can be made without having to select individual buses in the main window.

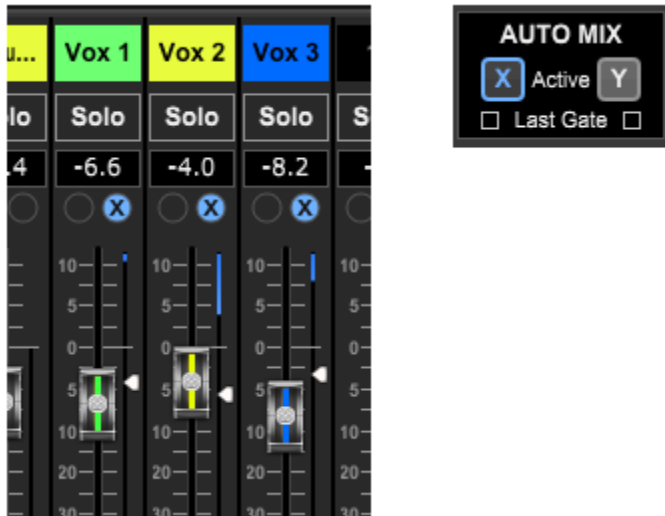

DCA Utility

Similar to the Buses utility, the DCA utility window allows all 4 DCA groups to be easily monitored and adjusted.

A custom set of channels, buses and/or DCA groups can also be configured in 2 user-defined windows. This has the added feature of expanding the channel strip to include the gain level, bus sends, and other information that is normally visible in the mixer tab in the main window.

7.14 Auto Mix

The Auto Mix function is very useful for meetings or panel discussions where multiple microphones are used for speech. The mic channels can be assigned to one of two auto mix groups that operate independently. The overall gain of all assigned channels in the same group will automatically be distributed according to the individual speaker's levels. Hence, microphones that are spoken to will take away gain from other unused channels, effectively reducing background noise and increasing output level before feedback. Click the X or Y auto mix buttons on the right side of the main window, then click the right-hand circle just above each channel fader that you want to assign to the auto mix. An X or Y will appear in the circle to indicate the assignment. The channels will be assigned to whichever auto mix group (X or Y) is currently active.

Whenever the auto mix bus is engaged, a blue gain reduction meter will indicate the amount of signal reduction. This allows the current speaker to be heard clearly while suppressing any noise from the other microphones. A white arrow also appears next to each fader assigned to the auto mix bus, which allows certain channels to be attenuated more or less to compensate for louder voices or more sensitive microphones.

When noise gates are used together with automixing, it may be helpful to select the Last Gate box beneath the auto mix button. This keeps the most recently active channel open, preventing that channel's background noise from being chopped off completely by the gate closing during pauses in speech.

8. MIDI

MIDI RX / TX	CH	CMD	No.	Value	Comment
Snapshots	1	Prg Chg	1-64		Program Changes 1-64 on Channel 1 can be used to recall snapshots 1-64 stored inside M AIR mixers.

9. Specifications

9.1 MR18

Processing

Number of processing channels	18 input channels, 4 FX return channels, 6 aux buses, main LR
Internal effects engines	4 true stereo
Signal processing	40-bit floating point
A/D-D/A conversion	24-bit @ 44.1 / 48 kHz, 115 dB dynamic range
Analog I/O latency*	0.8 ms

Connectors

Programmable mic preamps, designed by MIDAS PRO	16 XLR/TRS combo jacks, balanced
Line / Aux inputs, stereo	2 TRS, balanced
Main outputs	2 XLR, balanced
Aux outputs	6 XLR, balanced
Phones outputs	1 TRS
ULTRANET	1 RJ45
MIDI inputs / outputs	1/1 DIN
Ethernet	1 RJ45
Audio/Midi interface	1 USB Type B

Mic Input Characteristics

Preamp design	MIDAS PRO
THD + noise, unity gain, 0 dBu, 1 kHz	0.005%, unweighted
Phantom power, switchable per input	48 V
EIN noise, at +60 dB gain, 150R source	-125 dBu, 22 Hz - 22 kHz unweighted
CMRR, XLR, 1 kHz @ unity gain	Typically 65 dB
CMRR, XLR, 1 kHz @ +60 dB gain	Typically 90 dB

Input/Output Characteristics

Frequency range, @ 48 kHz sample rate, +/- 0.5 dB	20 Hz - 20 kHz
Dynamic range, analog in to analog out	108 db, 22 Hz - 22 kHz unweighted
A/D dynamic range, preamp to converter	110 db, 22 Hz - 22 kHz unweighted
D/A dynamic range, converter and output	111 db, 22 Hz - 22 kHz unweighted
Cross talk rejection @ 1 kHz, adjacent channels	90 dB
Mic/Line 1-16 Input impedance XLR jack, unbal. / bal.	10 k Ω
Non clip maximum input level, XLR	+23.5 dBu
Line 17-18 Input impedance, TRS unbal. / bal.	20 k Ω / 40 k Ω
Non clip maximum input level, TRS	+21 dBu

Output Characteristics

Output impedance, XLR	50 Ω
Maximum output level, XLR	+21 dBu
Phones output impedance	50 Ω
Maximum phones output level	+21 dBu
Noise @ unity gain, 1 input assigned, XLR and TRS	-87 dBu, 22 Hz - 22 kHz unweighted
Noise when muted, XLR and TRS	-90 dBu, 22 Hz - 22 kHz unweighted

USB Audio/MIDI Interface

Type	USB 2.0, type B
Supported operating systems	Windows 7 or higher**, Mac OS X 10.6.8 or higher, iOS 7 or higher (iPad), Linux
Supported sample rates	44.1 / 48 kHz
I/O audio channels	18 x 18
I/O MIDI channels	16 x 16 (1 port)

WLAN Module

Antenna	External, SMA connector, 50 Ω
Access Point, number of clients	Max. 4
IEEE 802.11 b/g standard	2.4 GHz
Frequency Range	2412-2462 MHz
WLAN channels (Wifi Client, Access Point)	1-11
Max Output Power	19 dBm (802.11 b) / 18 dBm (802.11 g)

Power

Switch-mode power supply	Autorange 100-240 V, (50/60 Hz)
Power consumption	30 W

Physical

Standard operating temperature range	5°C – 40°C (41°F – 104°F)
Dimensions	333 (W) x 149 (D) x 140 (H) mm, (13.1 x 5.9 x 5.8")
Weight	3.9 kg (8.6 lbs)

* including all channel and bus processing, excluding insert effects

** Windows ASIO driver available as download from midasconsoles.com; compatible to CoreAudio on Mac OS X and iOS

***Mac OS X is a trademark of Apple, Inc.

9.2 MR12**Processing**

Number of processing channels	16 input channels, 1 stereo USB return channel, 4 stereo FX return channels, 6 aux buses, main LR
Internal effects engines	4 true stereo
Signal processing	40-bit floating point
A/D-D/A conversion	24-bit @ 44.1 / 48 kHz, 115 dB dynamic range
Analog I/O latency*	0.8 ms

Connectors

Programmable mic preamps, designed by MIDAS PRO	4 XLR/TRS combo jacks, balanced
Line inputs	8 TRS, balanced
Main outputs	2 XLR, balanced
Aux outputs	2 TRS, balanced
Phones outputs	1 TRS
MIDI inputs / outputs	1/1 DIN
Ethernet	1 RJ45
USB port	Type A

Mic Input Characteristics

Preamp design	MIDAS PRO
THD + noise, unity gain, 0 dBu, 1 kHz	0.005%, unweighted
Phantom power, switchable per input	48 V
EIN noise, at +60 dB gain, 150R source	-125 dBu, 22 Hz - 22 kHz unweighted
CMRR, XLR, 1 kHz @ unity gain	Typically 65 dB
CMRR, XLR, 1 kHz @ +60 dB gain	Typically 90 dB

Input/Output Characteristics

Frequency range, @ 48 kHz sample rate, +/- 0.5 dB dB	20 Hz - 20 kHz
Dynamic range, analog in to analog out	108 db, 22 Hz - 22 kHz unweighted
A/D dynamic range, preamp to converter	110 db, 22 Hz - 22 kHz unweighted
D/A dynamic range, converter and output	111 db, 22 Hz - 22 kHz unweighted
Cross talk rejection @ 1 kHz, adjacent channels	90 dB
Mic/Line 1-4 input impedance XLR jack, unbal. / bal.	10 k Ω
Non clip maximum input level, XLR	+23.5 dBu
Hi-Z input impedance TRS jack, unbal. / bal.	1 M Ω / 2 M Ω
Line input 5-10 impedance TRS jack, unbal. / bal.	20 k Ω / 40 k Ω
Non clip maximum input level, TRS	+21 dBu

Output Characteristics

Output impedance, XLR	50 Ω
Maximum output level, XLR	+21 dBu
Aux 1-2 output impedance, TRS	50 Ω
Aux 1-2 maximum output level, TRS+21 dBu	
Phones output impedance	50 Ω
Maximum phones output level	+21 dBu
Noise @ unity gain, 1 input assigned, XLR and TRS	-87 dBu, 22 Hz - 22 kHz unweighted
Noise when muted, XLR and TRS	-90 dBu, 22 Hz - 22 kHz unweighted

WLAN Module

Antenna	External, SMA connector, 50 Ω
Access Point, number of clients	Max. 4
IEEE 802.11 b/g standard	2.4 GHz
Frequency Range	2412-2462 MHz
WLAN channels (Wifi Client, Access Point)	1-11
Max Output Power	19 dBm (802.11 b) / 18 dBm (802.11 g)

Power

Switch-mode power supply	Autorange 100-240 V, (50/60 Hz)
Power consumption	30 W

Physical

Standard operating temperature range	5°C – 40°C (41°F – 104°F)
Dimensions	333 (W) x 149 (D) x 95 (H) mm, (13.1 x 5.9 x 3.7")
Weight	2.9 kg (6.4 lbs)

*including all channel and bus processing, excluding insert effects

10. Effect Descriptions

Here is a list and brief description of the effects available on the M AIR mixers. When Stereo and Dual versions of an effect are offered, use the Stereo version when the left and right signal are to be altered together (e.g. on linked stereo channels or buses), or Dual when you want to dial different settings for the left and right signal.

Hall, Ambience, Rich Plate, Room, Chamber Reverb

These 5 reverb emulations are inspired by the Lexicon 480L. Hall simulates the reverberation that occurs when sound is recorded in medium to large-sized concert halls. Ambience creates a customizable virtual acoustic space to add warmth and depth without coloring the direct sound.

The PRE DELAY slider controls the amount of time before the reverb is heard following the source signal. DECAY controls the amount of time it takes for the reverb to dissipate. SIZE controls the perceived size of the space being created by the reverb. The DAMP slider adjusts the decay of the high frequencies within the reverb tail. DIFF(usion) controls the initial reflection density, and LEVEL controls the effect output.

LO and HI CUT allow the frequencies affected by the reverb to be narrowed. BASSMULT(plier) controls the low frequency build-up. SPREAD emphasizes the stereo effect of the reverb. SHAPE adjusts the contour of the reverberation envelope. MOD SPEED controls the reverb tail modulation rate and TAIL GAIN adjusts the volume of the reverb tail. The Rich Plate and Room reverbs allow the stereo ECHO DELAY and the delay FEEDBACK to be adjusted independently for each side. The Chamber reverb allows the stereo REFL(ection) DELAY and GAIN to be adjusted independently.

Plate Reverb

A plate reverb was originally created by sending a signal through a transducer to create vibrations on a plate of sheet metal which were then picked up as an audio signal. Our algorithm simulates that sound with high initial diffusion and a bright colored sound. The Plate Reverb will give your tracks the sound heard on countless hit records since the late 1950s. (Inspired by the Lexicon PCM-70)

PRE DELAY controls the amount of time before the reverberation is heard following the source signal. DECAY controls the amount of time it takes for the reverb to dissipate. SIZE adjusts the size of the virtual room created by the reverb effect. The DAMP knob adjusts the decay of high frequencies within the reverb tail. DIFF(USION) controls the initial reflection density. The LO CUT knob sets the frequency beneath which the source signal will not pass through the reverb. The HI CUT knob sets the frequency above which the source signal will not pass through the reverb. The BASS MULT(IPLIER) knob adjusts the decay time of the bass frequencies. XOVER controls the crossover point for bass. MOD DEPTH and SPEED control the intensity and speed of the reverb tail modulation.

Vintage Reverb

Based on the legendary EMT250, the Vintage Reverb delivers shimmering bright reverb that won't drown out or overpower your live or recorded tracks. Use Vintage Reverb to sweeten vocals and snare drums without sacrificing clarity.

When layer 1 is selected, the first slider on the left sets the reverb time from 4 milliseconds to 4.5 seconds. Slider 2 controls the low frequency multiplier decay time. Slider 3 controls the high frequency multiplier decay time. Slider 4 controls the amount of modulation in the reverb tail. When layer two is selected, slider 1 adjusts the pre delay. Slider 2 selects the low cut frequency. Slider 3 selects the Hi Cut frequency. Slider 4 adjusts the output level of the reverb.

When Layer 1 is selected, the far left encoder push button allows you to select between virtual front and rear outputs. Rear is suitable for drums due to it being less reflective. Front is well-suited for vocals and other dynamic instruments. The Vintage button enables the simulation of the input transformers.

Vintage Room

Vintage Room simulates the reverberation that occurs when sound is recorded in a small room. When you want to add a bit of warmth and just a touch of reverb, the Vintage Room breathes life into close-miced guitar and drum tracks. (Inspired by the Quantec QRS)

The VU meter displays the input and output levels. Set the early reflection times for the left and right channel with ER DELAY L and ER DELAY R. ER LEVEL sets the loudness of the early reflection level. REV DELAY controls the amount of time before the reverberation is heard following the source signal. HI/LOW MULTIPLY adjusts the decay time of the high and bass frequencies. TIME shows the duration of the reverb effect. ROOM SIZE adjusts the size of the room effect being created incrementally from small to large. HIGH CUT sets the frequency above which the source signal does not pass through the reverb. DENSITY manipulates the reflection density in the simulated room. (This slightly changes the reverb decay time). LOW CUT sets the frequency below which the source signal does not pass through the reverb.

Gated Reverb

This effect was originally achieved by combining a reverb with a noise gate. Our gated reverb creates the same impression by a special shaping of the reverb tail.

Gated Reverb is especially effective for creating a 1980s-style snare sound or to enlarge the presence of a kick drum. (Inspired by the Lexicon 300/480L)

PRE DELAY controls the amount of time before the reverberation is heard following the source signal. DECAY controls the amount of time it takes for the reverb to dissipate. ATTACK controls how fast the reflection density builds up. DENSITY shapes the reverb decay tail. The higher the density, the greater the number of sound reflections. SPREAD controls how the reflection is distributed through the envelope of the reverb. The LO CUT knob sets the frequency beneath which the source signal will not pass through the reverb. The HiSvFr/ HiSvGn knobs adjust a Hi-Shelving filter at the input of the reverb effect. DIFF(USION) controls the initial reflection density.

Reverse Reverb

Reverse Reverb takes the trail of a reverb, turns it around, and places it in front of the sound source. Use the swelling crescendo of the Reverse Reverb to add an ethereal quality to vocal and snare tracks. (Inspired by the Lexicon 300/480L)

Adjusting the PRE DELAY knob adds up to 200 milliseconds of time before the reverb follows the source signal. The DECAY knob adjusts the time it takes for the reverb to completely dissipate. RISE controls how quickly the effect builds up. DIFF(USION) controls the initial reflection density. SPREAD controls how the reflection is distributed through the envelope of the reverb. The LO CUT knob sets a low frequency beneath which the source signal will not pass through the reverb. The HiSvFr/HiSvGn knobs adjust a Hi-Shelving filter at the input of the reverb effect.

Stereo Delay

Stereo Delay provides independent control of left and right delay (echo) times and features high and low pass filters for enhanced tone shaping of the delayed signals. Use the Stereo Delay to give your mono signals a wide presence in the stereo field.

The MIX control lets you blend the source signal and the delayed signal. TIME adjusts the master delay time up to three seconds. LO CUT adjusts the low frequency cut, allowing lower frequencies to remain unaffected by the delay. HI CUT adjusts the high frequency cut, allowing higher frequencies to remain unaffected by the delay. FACTOR L sets the delay on the left channel to rhythmic fractions of the master delay time. FACTOR R sets the delay on the right channel to rhythmic fractions of the master delay time. OFFSET LR adds a delay difference between the left and right delayed signals. The FEED LO CUT/HI CUT adjusts filters in the feedback paths. FEED L and FEED R control the amount of feedback for the left and right channels. MODE sets the feedback mode: Mode ST sets normal feedback for both channels, X crosses feedbacks between left and right channels. M creates a mono mix within the feedback chain.

3-Tap Delay

Sometimes called a 3-Tap Delay, the Triple Delay provides three delay stages with independent frequency, gain, and pan controls. Create time-based echo effects with the Triple Delay to increase the sense of stereo separation.

TIME BASE sets the master delay time, which is also the delay time for the first stage. GAIN BASE sets the gain level of the first stage of the delay. PAN BASE sets the position of the first delay stage in the stereo field. LO CUT sets the frequency at which the source signal can begin passing through the delay. HI CUT sets the frequency at which the source signal no longer passes through the delay. X-FEED indicates that stereo cross-feedback of the delays is active. MONO activates a mono mix of both channels for the delay input. FEED adjusts the amount of feedback. FACTOR A controls the amount of delay time in the second stage of the delay. GAIN A controls the gain level of the second delay stage. PAN A sets the position of the second delay stage in the stereo field. FACTOR B controls the amount of delay time in the third stage of the delay. GAIN B controls the gain level of the third delay stage. PAN B sets the position of the third gain stage in the stereo field.

Rhythm Delay

The Rhythm Delay provides 4 stages of delay with independently adjustable gain and rate, allowing unique syncopation to be created in the layered repeats.

TIME BASE sets the master delay time, which is also the delay time for the first stage. GAIN BASE sets the gain for the first stage. SPREAD positions the first delay stage in the stereo field. A global FEEDBACK, LO and HI CUT adjustment are also available. FACTOR A, B and C adjust the delay rate relative to the global TIME BASE setting for the 2nd, 3rd and 4th stages respectively. Each stage also has its own GAIN adjustment. MONO activates a mono mix of both channels for the delay input. X-FEED indicates that stereo cross-feedback of the delays is active.

Stereo Chorus

Chorus samples the input, slightly detunes it and mixes it with the original signal to produce a somewhat thicker, shimmering sound. Use it to thicken up background vocals, or to double the sound of brass and woodwind instruments.

Whereas DELAY L/R set the total amount of delay for the left and right channel, WIDTH determines the amount of modulated delay. SPEED sets the modulation speed. MIX adjusts the balance of the dry and wet signals. You can further sculpt the sound by trimming some of the low and high end from the effected signal with the LO and HI CUT knobs. Additionally, the PHASE knob can tweak the phase offset of the LFO between left and right channel and the SPREAD knob adjusts how much of the left channel is mixed into the right and vice versa. Finally, the WAVE knob blends between the “Danish-style” digital triangular chorus sound and the classic analog sine wave.

Stereo Flanger

The Flanger emulates the phase-shifting sound (comb-filtering) originally created by applying pressure against the flange of the reel on a tape recorder. This effect creates a unique “wobbly” sound that is quite dramatic when used on vocals and instruments.

The controls of this effect are nearly identical to the Chorus effect block. Additionally, the FEEDBACK can be adjusted with positive and negative amounts and also band-limited with the FEED HC (high-cut) and FEED LC (low-cut) knobs.

Stereo Phaser

A Stereo Phaser, or phase shifter, applies multiple STAGES of modulated filters to the input signal to create a “notch” in the frequency response, and then applies a MIX with the original for a “swirling” effect. Use the Stereo Phaser to add a “spaced-out” sound to vocal or instrument tracks.

SPEED adjusts the LFO rate and DEPTH sets the LFO modulation depth. The BASE knob adjusts the frequency range of the modulated filters. The resonance is adjusted with the RESO knob. The WAVE knob shapes the symmetry of the LFO waveform and PHASE dials in an LFO phase difference between the left and right channel. The modulation source can also be the signal envelope, which produces vowel-like opening and closing tones. The ENV MOD knob adjusts how much this effect takes place (positive and negative modulation is possible), and the ATTACK, HOLD and RELEASE knobs all tailor the response of this feature.

Dimensional Chorus

The Dimensional Chorus offers the most user-friendly and classic sounds, best described as “space” and “dimensional”. The 4 MODE buttons can be engaged individually or simultaneously for light chorus or very thick, exaggerated modulation.

Mood Filter

The Mood Filter uses an LFO generator and an auto-envelope generator to control a VCF (voltage-controlled filter), as well as a side chain function where the channel B signal controls the envelope of channel A. When applied to electronic instruments, the Mood Filter can be used to emulate the natural sound of acoustic instruments. (Inspired by the MiniMoog)

This filter can be modulated with the signal’s envelope using the ENV MOD (with positive and negative amounts), ATTACK and RELEASE knobs, or the LFO can modulate the filter. The WAVE knob selects between 7 different wave forms – triangular, sine, saw plus, saw minus, ramp, square, and random. The PHASE can be off set by up to 180 degrees. The SPEED knob adjusts the rate of the LFO and the DEPTH adjusts the amount of LFO modulation. Adjust the resonance of the filter until self-oscillation with the RESO(nance) knob. BASE adjusts the range of the filter from 20 Hz to 15 kHz. The MODE switch selects between low pass (LP), high-pass (HP), band-pass (BP) and Notch. Use the MIX knob to blend the effected signal with the dry sound. With the 4 POLE switch engaged, there will be a steeper slope than the OFF (2 pole) setting. The DRIVE knob adjusts the level and can also introduce an overdrive effect (as with real analogue filters) if pushed hard. In Sidechain mode, only the left input signal is processed and fed to both outputs. The envelope of the right input signal can be used as a modulation source.

Rotary Speaker

Rotary Speaker emulates the sound of a Leslie rotating speaker. The Rotary Speaker provides more flexibility than its electro-mechanical counterpart, and can be used with a variety of instruments, and even vocals, to create a whirling, psychedelic effect.

The LO SPEED and HI SPEED knobs adjust the rotational speed of the SLOW and FAST Speed selection, and can be toggled with the FAST button. The ACCEL(eration) knob adjusts how quickly the speed increases and decreases from the Slow mode to the Fast mode. The rotation effect can also be disengaged with the STOP button, which will stop the movement of the speakers. DISTANCE adjusts the distance between the Rotary speakers and the virtual microphone.

Stereo Tremolo

Stereo Tremolo creates an up and down volume change at a constant and even tempo just like the guitar amps of yesteryear. Use the Stereo Tremolo to add a unique “surf-music” texture to a vocal or instrument track.

SPEED adjusts the LFO rate and DEPTH sets the amount of modulation. PHASE can be used to set an LFO phase difference between the left and right channel, which can be used for panning effects. The WAVE knob blends the LFO waveform between triangular and square shape. The signal envelope, shaped by ATTACK, HOLD and RELEASE, can be used to modulate the LFO speed (ENV SPEED) and the LFO modulation depth (ENV DEPTH).

Sub Octaver

The Sub Octaver provides two channels of sub harmonics generation, one or even two octaves below the input signal.

Adjust the DIRECT knob to blend the “dry” signal with the lower octaves. Use the RANGE switch to optimize the tracking by selecting the frequency range of the input signal. The OCT1 and OCT2 knobs adjust how much 1 octave down and 2 octaves down content is included.

Delay + Chamber

Here we have combined Delay and Chamber reverb, so a single device can provide a variety of delay settings, plus add just the right type and amount of reverb to the selected signal. This device only uses one FX slot. (The Reverb is Inspired by the Lexicon PCM 70)

Use the BALANCE knob to adjust the ratio between delay and reverb. Low frequencies can be excluded with the LO CUT knob, and the MIX adjusts how much of the effect is added to the signal. The TIME knob adjusts the delay time for the left channel delay, and the PATTERN sets the delay ratio for the right channel delay. Adjust the FEEDBACK and trim some high frequencies with the FEED HC (high-cut) knob. The XFEED knob allows you to send the delay sound to the reverb effect, so instead of running completely parallel, the reverb affects the echos to a selected degree. The PREDELAY knob determines the hesitation before the reverb affects the signal. The DECAY knob adjusts how quickly the reverb fades. The SIZE controls how large or small the simulated space is (room, cathedral, etc.). The DAMPING knob determines the decay of high frequencies within the reverb tail.

Chorus + Chamber

Taking up only one FX slot, the Chorus + Chamber effect combines the shimmer and doubling characteristics of a studio-grade Chorus with the sweet sound of a traditional Chamber reverb. (Reverb is Inspired by the Lexicon PCM 70)

The BALANCE knob adjusts the balance between chorus and reverb. Low frequencies can be excluded with the LO CUT knob, and the MIX knob adjusts how much of the effect is added to the signal. SPEED, DELAY and DEPTH adjust the rate, delay, and modulation depth of the chorus. The LFO PHASE between left and right channel can be offset by up to 180 degrees, and WAVE adjusts the LFO waveform from a sine wave to triangular wave. The PREDELAY knob determines the hesitation before the reverb affects the signal. The DECAY knob adjusts how quickly the reverb fades. The SIZE controls how large or small the simulated space is (room, cathedral, etc.). The DAMPING knob determines the decay of high frequencies within the reverb tail.

Flanger + Chamber

Add the mind-bending, filter-sweeping effect of a state-of-the-art Flanger to the elegant sweetening of a traditional Chamber reverb — all in one FX slot. (Reverb is Inspired by the Lexicon PCM 70)

The BALANCE knob adjusts the ratio between flanger and reverb. Low frequencies can be excluded with the LO CUT knob, and the MIX knob adjusts how much of the effect is added to the signal. SPEED, DELAY and DEPTH adjust the rate, delay, and modulation depth of the flanger. FEEDBACK can be adjusted with positive and negative amounts. The PHASE can be off set by up to 180 degrees. The PREDELAY knob determines the hesitation before the reverb affects the signal. The DECAY knob adjusts how quickly the reverb fades. The SIZE controls how large or small the simulated space is (room, cathedral, etc.). The DAMPING knob determines the decay of high frequencies within the reverb tail.

Delay + Chorus

This combination effect merges a user-definable Delay (echo) with a studio quality Chorus sure to fatten up even the “skinniest” track. Uses only one FX slot. (Inspired by the TC Electronic D-Two)

The TIME knob adjusts the delay time, and the PATTERN knob sets the delay ratio for the right channel and negative values activate a cross feedback between the two channels. The FEEDHC knob adjusts the delay high-cut frequency, while the FEEDBACK knob adjusts the number of repeats. The X-FEED knob allows you to send the delay sound to the chorus effect. The BALANCE knob adjusts the ratio between delay and chorus. SPEED, DELAY and DEPTH adjust the rate, delay, and modulation depth of the chorus. The right channel LFO PHASE can be offset by up to 180 degrees, and WAVE adjusts the chorus character by shaping the LFO waveform from sine wave to triangular wave. Use the MIX knob to blend the effected signal with the “dry” sound.

Delay + Flanger

This handy dynamic duo blends the “woosh” of soaring jet planes with classic Delay, and can be adjusted from mild to wild. This combination effect only takes up one FX slot. (Inspired by the TC Electronic D-Two)

The TIME knob adjusts the delay time, and the PATTERN knob sets the delay ratio for the right channel and negative values activate a cross feedback between the two channels. The FEEDHC knob adjusts the delay high-cut frequency, while the FEEDBACK knob adjusts the number of repeats. The X-FEED knob allows you to send the delay sound to the flanger effect. The BALANCE knob adjusts the ratio between delay and flanger. SPEED, DELAY and DEPTH adjust the rate, delay, and modulation depth of the flanger. The right channel LFO PHASE can be offset by up to 180 degrees, and FEED (positive and negative amounts) adjusts the feedback effect. Use the MIX knob to blend the effected signal with the “dry” sound.

Modulation Delay

Modulation Delay combines three of the most used time modulation effects into one easy-to-operate unit, featuring true-stereo delay with a lush chorus, topped off with three reverb models to choose from.

The BALANCE knob adjusts ratio of delay to reverb. The processor chain can operate as serial where one effect flows into the next, or parallel where each effect is applied to the source signal independently. TIME, FEED(back), LOW and HI CUT all affect the delay. Modulation DEPTH and RATE are adjustable. Three types of reverb are available – ambience, club and hall – with adjustable DECAY and HI DAMP.

Graphic and Tru EQ

The dual and stereo EQs are standard graphic equalizers that provide 31 bands of adjustment between 20 Hz and 20 kHz. A master volume slider compensates for changes in volume caused by the equalization. A maximum boost or cut of 15 dB is available for each band.

The TruEQ incorporates a special algorithm that compensates for the gain adjustment overlapping effect that adjacent frequency bands have on one another. On a standard EQ, when neighboring bands are boosted together, the resulting effect is magnified beyond what is visible from the positioning of the sliders.

Graphic equalizer without frequency response correction.

This compensated EQ will produce an adjustment that is identical to the actual positioning of the sliders.

Graphic equalizer with frequency response correction.

DeEsser

The DeEsser effect allows the sibilance to be controlled for singers that have a pronounced “S” sound. Separate knobs allow the low and high bands to be adjusted, and the effect can be optimized for male and female voices.

Xtec EQ1

Inspired by the Pultec EQP-1a, this passive equalizer is a very powerful tool for sound enhancement.

GAIN allows compensation for level changes resulting from frequency adjustments. Toggle the IN switch to engage or disengage the effect. Select the low frequency with the LO FREQ knob, adjust the amount of enhancement with the LO BOOST, then adjust the attack with the LO ATT. The same adjustments are available for the high frequencies.

Xtec EQ5

This Pultec emulation is a classic analog passive equalizer that offers very warm and musical frequency sculpting. Simply select the center frequency for the 3 bands, then adjust how much low and high you want to boost and how much midrange you want to cut.

Wave Designer

Wave Designer is a powerful tool for adjusting signal transients and dynamics, such as attack and sustain. Use it to make a snare drum really “crack” in the mix or level out volume inconsistencies of slap bass tracks. (Inspired by the SPL Transient Designer)

Adjusting the ATTACK knob can add punch or tame overly dynamic signals. Increasing the SUSTAIN knob acts in a similar way as a compressor, allowing the peaks to carry longer before decay. The effect can also be used to reduce the sustain for a more staccato sound. The GAIN knob compensates for level changes caused by the effect.

Precision Limiter

Stereo Precision Limiter allows you to set a precise volume limit, ensuring distortion-free, optimal signal integrity. Use the Stereo Precision Limiter to boost quiet signals or preventing clipping while preserving the level of “hot” signals.

AUTOGAIN activates an additional long-term gain correction, allowing automatic gain scaling of varying input level ranges. STEREO LINK applies limiting to both channels equally when activated. INPUT GAIN provides up to 18 dB of gain to the input signal prior to limiting. OUTPUT GAIN sets the final gain level of the processed signal. SQUEEZE adds compression to the signal to add punch and a slight distortion depending on the amount you dial in. ATTACK sets the attack time, ranging from 0.05 mS to 1 mS. RELEASE adjusts the release time from 0.05 mS to 1.04 seconds. KNEE adjusts the soft limiting threshold point from hard limiting (0 dB) to maximum soft limiting (10 dB).

Combinator

The Combinator emulates famous broadcasting and mastering compressors, utilizing automatic parameter control that produces very effective yet “inaudible” results.

The MIX knob allows some of the source signal to pass through unaffected. ATTACK and RELEASE have dedicated controls, and an Auto Release function can be engaged. Global X-OVER, RATIO, THRESH(old) and GAIN controls are available. Engage the Spectral Balance Control (SBC) to allow automatic gain balancing between the audio bands and its SPEED control to determine how aggressively the effect works. The meters can also display band reduction or the SBC gain balance, and can display peak outputs. The THRESH(old) and GAIN can be adjusted for each band independently.

Fair Compressor

This model of a Fairchild 670 delivers some of the finest colorations in compressor history. Two small trim VRs, BIAS and BALANCE, preset the control side chain action, a 6-step knob determines the timing, and the 2 large INPUT GAIN and THRESHOLD knobs adjust the levels. There are models available for dual, stereo-linked, or mid/side operation.

Leisure Compressor

This model of a popular tube-based optical compressor provides natural and effortlessly musical compression, inspired by the Teletronix LA-2A. Simply adjust the input GAIN and PEAK REDUCTION knob to dial in the amount of desired compression, then adjust the OUTPUT GAIN knob for the desired output level. The COMP setting will give a gentle compression ratio, whereas the LIMIT setting results in a higher ratio.

Ultimo Compressor

The Ultimo Compressor is based on the Urei 1176LN Limiting Amplifier and authentically captures the smooth character of the original class-A output stage in its FET's legendary fast attack.

Start with the INPUT and OUTPUT knobs at the -24 position for unity gain and set the ATTACK and RELEASE knobs fully counterclockwise. Select the compression ratio, then raise the ATTACK knob to lightly compress the signal. Increase the ratio for heavier compression and experiment with ATTACK, RELEASE and INPUT levels to achieve your desired result. Compensate for overall level reduction with the OUTPUT knob.

Enhancer

These Enhancers are so called "Psycho EQs". They can enhance the signal spectrum in bass, midrange and high frequencies but they differ from traditional equalizers. When you need to generate maximum punch, clarity and detail, without turning up the overall volume, our enhancers are the solution. (Inspired by the SPL Vitalizer)

Adjust the BASS, MID and HI GAIN knobs to add or reduce content in those spectrums. The BASS and HI Frequencies can be specifically selected, while the MID Q (bandwidth) can be adjusted instead. The OUT GAIN knob compensates for changes in level resulting from the effect, and the SPREAD knob (Stereo version only) emphasizes the stereo content for a wider mix. Engage the SOLO MODE to isolate only the audio resulting from the effect so you can hear exactly what you're adding to the mix.

Exciter

Exciters increase presence and intelligibility in live sound applications, and are indispensable for adding clarity, air and harmonic overtones in the recording studio. This effect is particularly useful for filling out the sound in difficult rooms and for producing a more natural live/recorded sound. (Inspired by the famous Apex Aural Exciter)

Set the frequency of the side-chain filter with the TUNE knob, and further shape the filter slope with the PEAK and ZERO FILL knobs. Turning the TIMBRE knob left of center adds more odd harmonics, while turning it right of center adds more even harmonics. Adjust the harmonic content added to the signal with the HARMONICS knob, and blend in the effected signal with the MIX knob. Engage the SOLO MODE to isolate only the audio resulting from the effect so you can hear exactly what you're adding to the mix.

Stereo Imager

A Stereo Imager is typically used to control the placement of a signal within the stereo field during mixdown or mastering. Modeled after the BEHRINGER Edison rack unit, the Stereo Imager will lend a professional quality to your live and recording performances.

The BALANCE knob allows you to emphasize the mono or stereo components of the input signal. The mono and stereo signals can be panned independently with the MONO PAN and STEREO PAN knobs. OUT GAIN is used to compensate for level changes resulting from the effect. The phase can also be shifted using the shelving knobs. Select the frequency and bandwidth (Q) using the corresponding knobs, then adjust the gain with the SHV GAIN knob.

Edison EX1

The EDISON EX1+ is a remarkably effective tool that allows manipulation of the stereo field. The effect offers stereo and mid/side input and output and a phase correlation meter. Exaggerate the stereo field with the ST SPREAD knob and adjust the ratio of mono to stereo content with the BALANCE knob. The CENTER DIST knob allows the mono content to be panned. Compensate for level changes with the OUTPUT GAIN knob.

Sound Maxer

Inspired by the Sonic Maximizer 482i, this effect restores natural brilliance and clarity to any audio signal by adjusting the phase and amplitude integrity to reveal more of the natural texture of the sound. LO CONTOUR adjusts the level of phase-corrected low frequencies and PROCESS adjusts the level of phase-corrected high frequencies. GAIN compensates for level changes caused by the effect.

Guitar Amp

Modeled after the Tech 21 SansAmp, the Stereo / Dual Guitar Amp simulates the sound of plugging into a real guitar amp. From shimmering cleans to saturated crunch, the Stereo / Dual Guitar Amp allows an electric guitar player to sound great without using an amp on stage.

The PREAMP knob adjusts the amount of input gain prior to the band-specific distortion adjustment. BUZZ adjusts the low-end breakup, PUNCH adjusts the midrange distortion, and CRUNCH tailors the high-frequency content and distortion for smooth or cutting notes. The DRIVE knob simulates the amount of power amp distortion from a tube amp. The LOW and HIGH knobs allow EQ adjustment independent of distortion content, and the overall output is controlled by the LEVEL knob. The CABINET simulation can be bypassed if the guitarist is already using a real cab, which allows the effect to function like a boost or distortion pedal. The Dual Guitar Amp allows the left and right channels to be adjusted independently.

Tube Stage

Tube Stage/Overdrive is a versatile effect capable of emulating a variety of modern and classic tube preamps. Available in stereo and dual-mono versions, use Tube Stage/Overdrive to dial in warm and fuzzy sounds from subtle to fully saturated.

DRIVE adjusts the amount of harmonics being driven by the effect. EVEN and ODD adjust the amount of even and odd harmonics. GAIN adjusts the output gain of the effect. LO CUT sets the input frequency below which the source signal will not pass through the effect. HI CUT sets the input frequency above which the input signal will not pass through the effect. BASS GAIN/FREQ adjust a low shelving filter at the output of the effect. TREBLE GAIN/FREQ adjust a high shelving filter at the output of the effect.

Stereo / Dual Pitch

Pitch shifting is often used in two different ways. One is to set the Mix knob lower and only use the Cent knob to make a small offset in pitch between the wet and dry tones. This results in a “voice doubling” effect that thickens the overall sound in a more subtle way. The extreme use of the effect is to turn the Mix knob fully clockwise so the entire signal is effected. This way, the signal can be shifted into other keys up to an octave above or below the original. When used on a voice, this results in a “chipmunk” sound or a low Darth Vader effect.

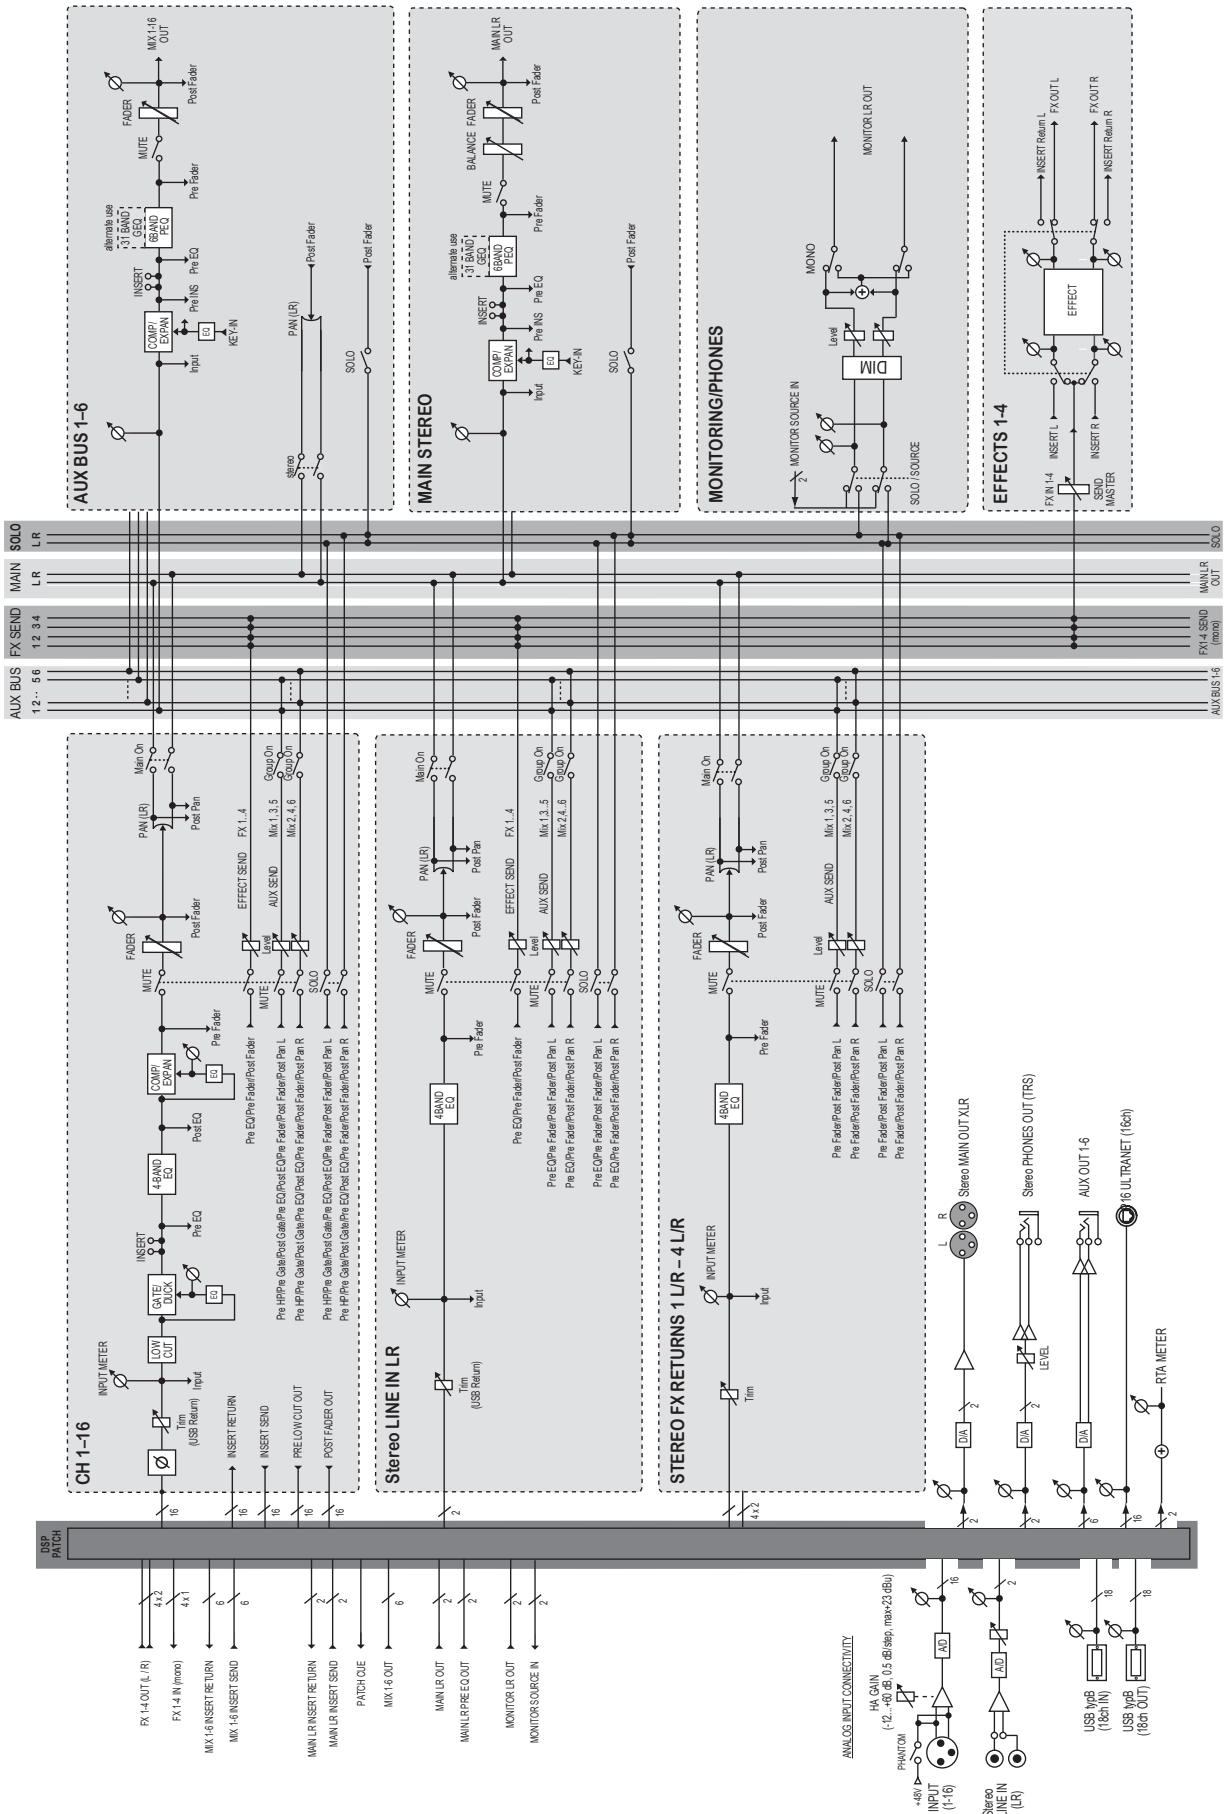

When the SEMI and CENT knobs are set at 12:00, the pitch is not altered. Making adjustments by semitone will have a very pronounced effect, whereas changes to the CENT knob will be very minor. The DELAY knob creates a time difference between the wet and dry sound. The LO and HI CUT knobs allow the effected signal to be band-limited. The Dual Pitch effect allows the left and right channels to be adjusted independently, and allows GAIN compensation and panning of the two channels.

11. Instructional Videos

A Youtube playlist with over 40 tutorial videos can be found by searching for “X AIR How To Videos” on youtube.com. These provide a great source of supplementary information to this manual, and cover everything from basic setup, wireless connection scenarios and channel configuration to advanced FX routing and global settings.

Contains Transmitter Module FCC ID: W70MRF24WG0MAMB

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules.

These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Caution!

The manufacturer is not responsible for any radio or TV interference caused by unauthorized modification to this equipment. Such modifications could void the user authority to operate the equipment.

FCC RF Radiation Exposure Statement:

- (1) This Transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.
- (2) This equipment complies with FCC RF radiation exposure limits set forth for uncontrolled environment. This equipment should be installed and operated with minimum distance of 20 centimeters between the radiator and your body.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

Caution!

The manufacturer is not responsible for any radio or TV interference caused by unauthorized modifications to this equipment. Such modifications could void the user authority to operate the equipment.

Warning: Operation of this equipment in a residential environment could cause radio interference.
